15. Employment Applications

1. Writing in Business, Industry and Government

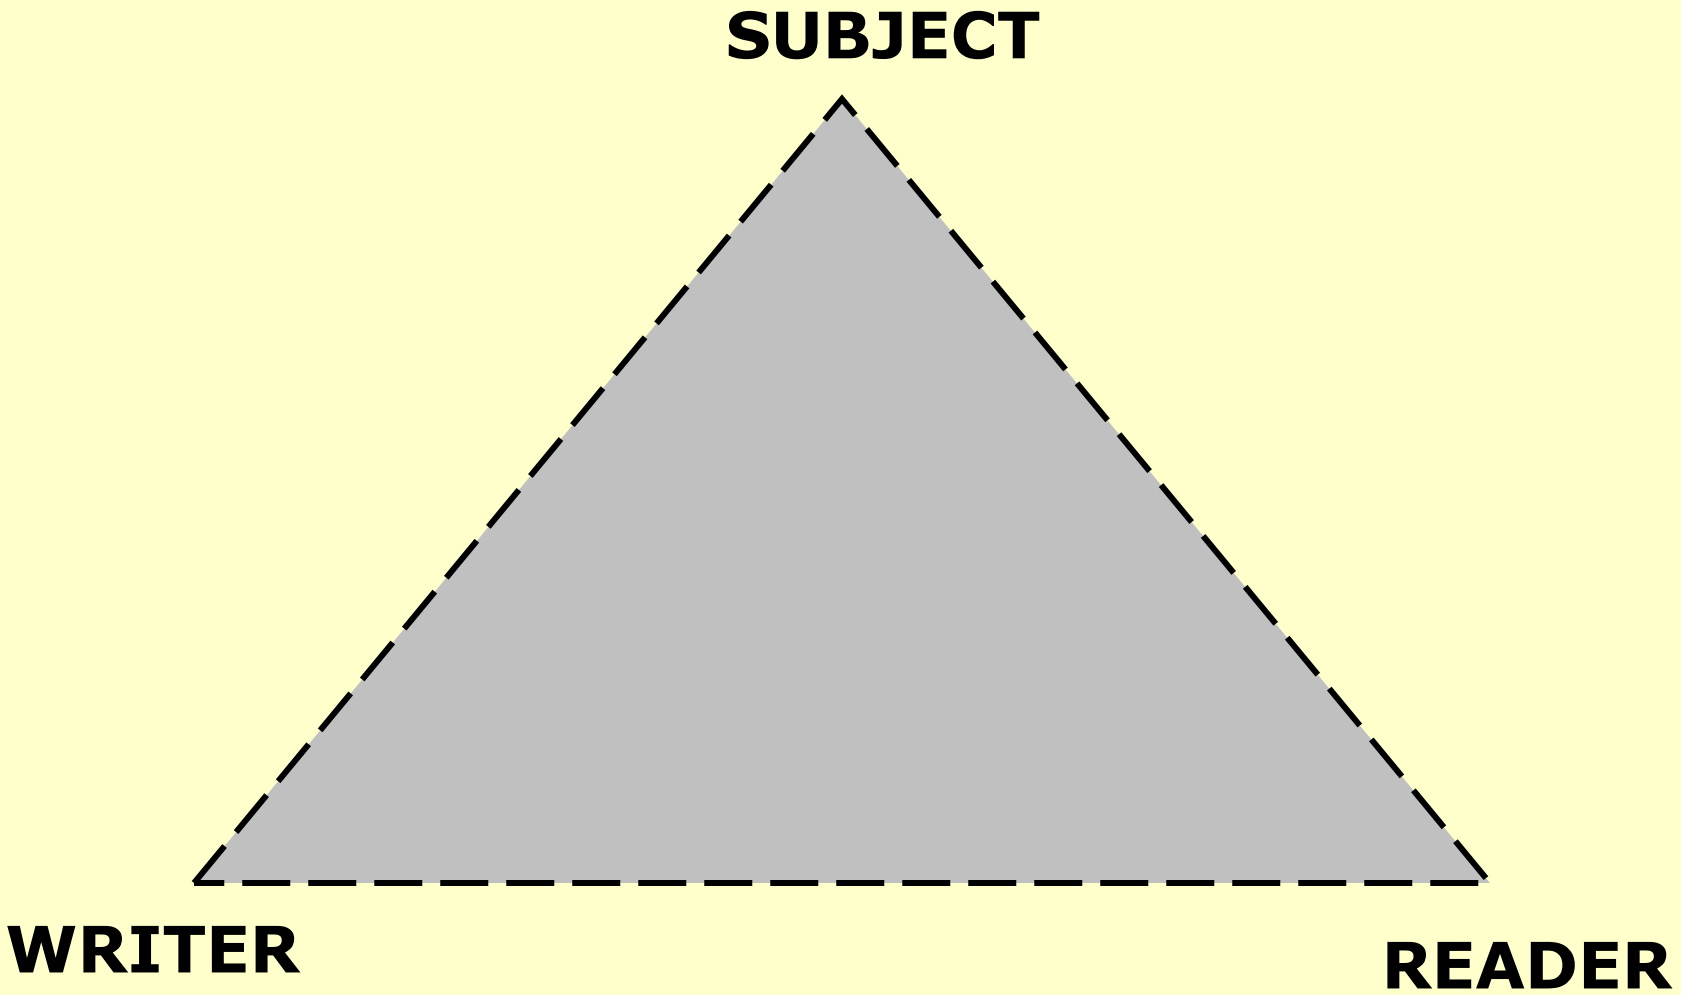

- Technical writing is an act of communication rather than an act of self-expression.
- The information you present is the more important than your attitude towards it.
- Technical writing is simply, the writing you as a person in a particular field are going to be doing when you are on the job.

Communication Vs Self-Expression

- In college writing you write primarily as an act of self-expression.
- College writing is primarily creative and expository.
- On the job you will write primarily as an act of communication.
- On the job your writing will be primarily technical, or instrumental.

Relationship Between Reader, Writer and Subject

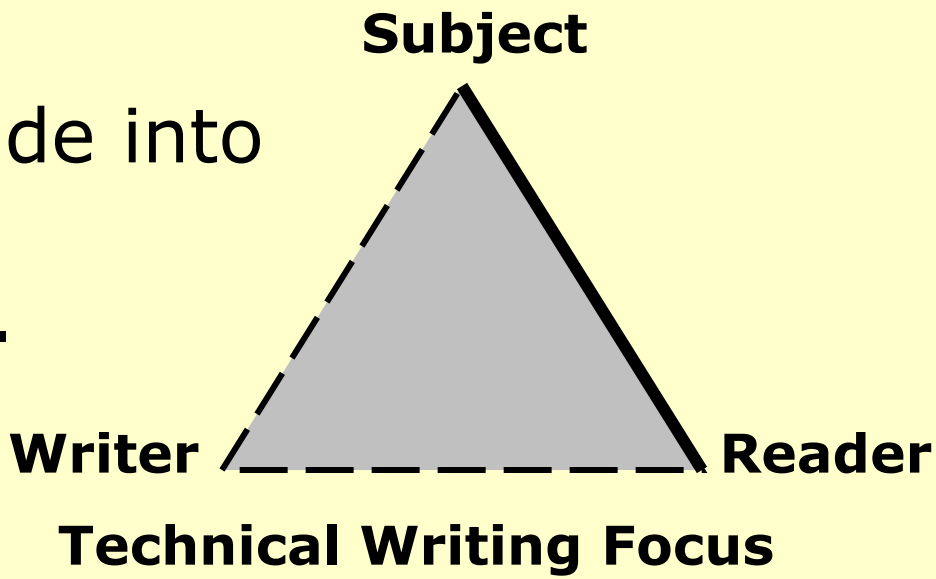

- Technical writing is not a creative writing, a report is different from a poem, although as a technical writer you must be creative.
- Technical writing is not expository writing, a report is not an essay. Although, as a technical writer you will use description, narration and argumentation.

THE COMMUNICATION TRIANGLE

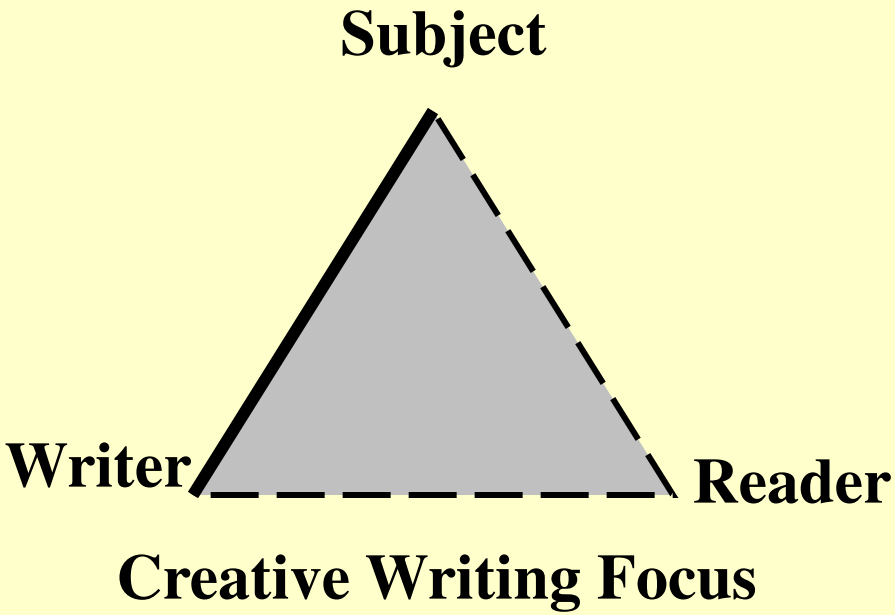

Technical Writing

- Technical writing, highlights the link between the reader and the subject.
- As a writer you fade into the background (Secondary Role).

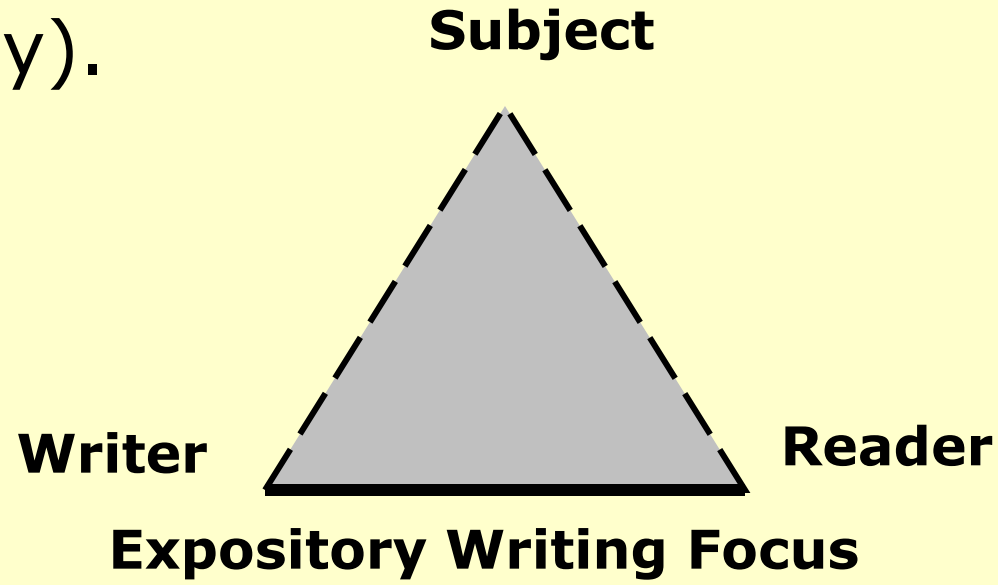

Creative Writing

- Creative writing, highlights the link between the writer and the subject (Poem).

Expository Writing

- Expository writing, highlights the link between the writer and the reader (Essay).

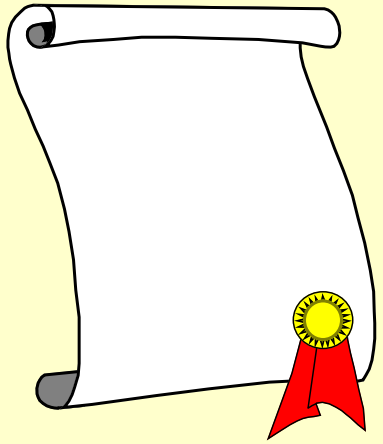

Major Types of On-the-job Writing

- ***Correspondence:*** The letters and memos that flow between individuals in organizations, either to provide a written record of conversations or to serve as brief exchange of information on limited topics.
- ***External Publications*:** The formal pieces of writing that go outside the organization and serve to project the organization's public image.
- ***Internal Documents*:** The reports, proposals, plans and procedures that stay inside the organization and keep the organizational wheels turning.

Correspondence

- Job-related Technical correspondences are of three varieties:
- Memos.
- Letterhead Letters.
- Nonletterhead Letters.

ARCHIBALD ENTERPRISES, LTD., AKRON, OHIO 44307

Interoffice Memorandum

TO: Peter Darrington, Manager
Mid-Central Sales

FROM: Harold P. Miller, Vice President
Sales Division

SUBJECT: Second Quarter Sales Report

DATE: July 22, 1983

I was quite pleased to note that sales in the Mid-Central section were up 22 percent from the First Quarter, 1983. No doubt, the Salem Quarry contract accounted for a good bit of the increase, but at the same time I see that all of your people have made more contacts and increased their sales volumes over the previous quarter. This comes from dynamic leadership, Peter! You're doing a fine job with the Mid-Central section, and you have my full support with your new programs. Congratulations! And keep up the good work!

And please relay my congratulations and encouragement to every one of your sales staff. They have done a fine job this past quarter, too.

Representative Memo

SCIENCE ASSOCIATES PUBLISHERS

425 Madison Avenue

January 30, 1983

Professor Edwin V. Anderson
Deparment of English
Bradley University
Peoria, Illinois 61600

Dear Professor Anderson:

I refer to our very pleasant telephone conversation of January 26th, and I would like to thank you for agreeing to review and critique Harold Adams' new book Essays in Word Processing and Text Editing.

I am enclosing the manuscript, and we would very much appreciate having your review and comments by March 15th. This will enable us to come to a prompt decision about publishing and be ready for marketing by the beginning of 1984.

An honorarium of $500 (plus expenses) has been set aside for you.

You are at liberty to mark up the pages of the manuscript with suggestions, corrections, and annotations. Additionally, a letter giving an overview, your ideas about pricing and marketing, and any other suggestions you might have would be quite welcome.

Should you have any questions, please call me at Science Associates during business hours or at home (496) 768-3329.

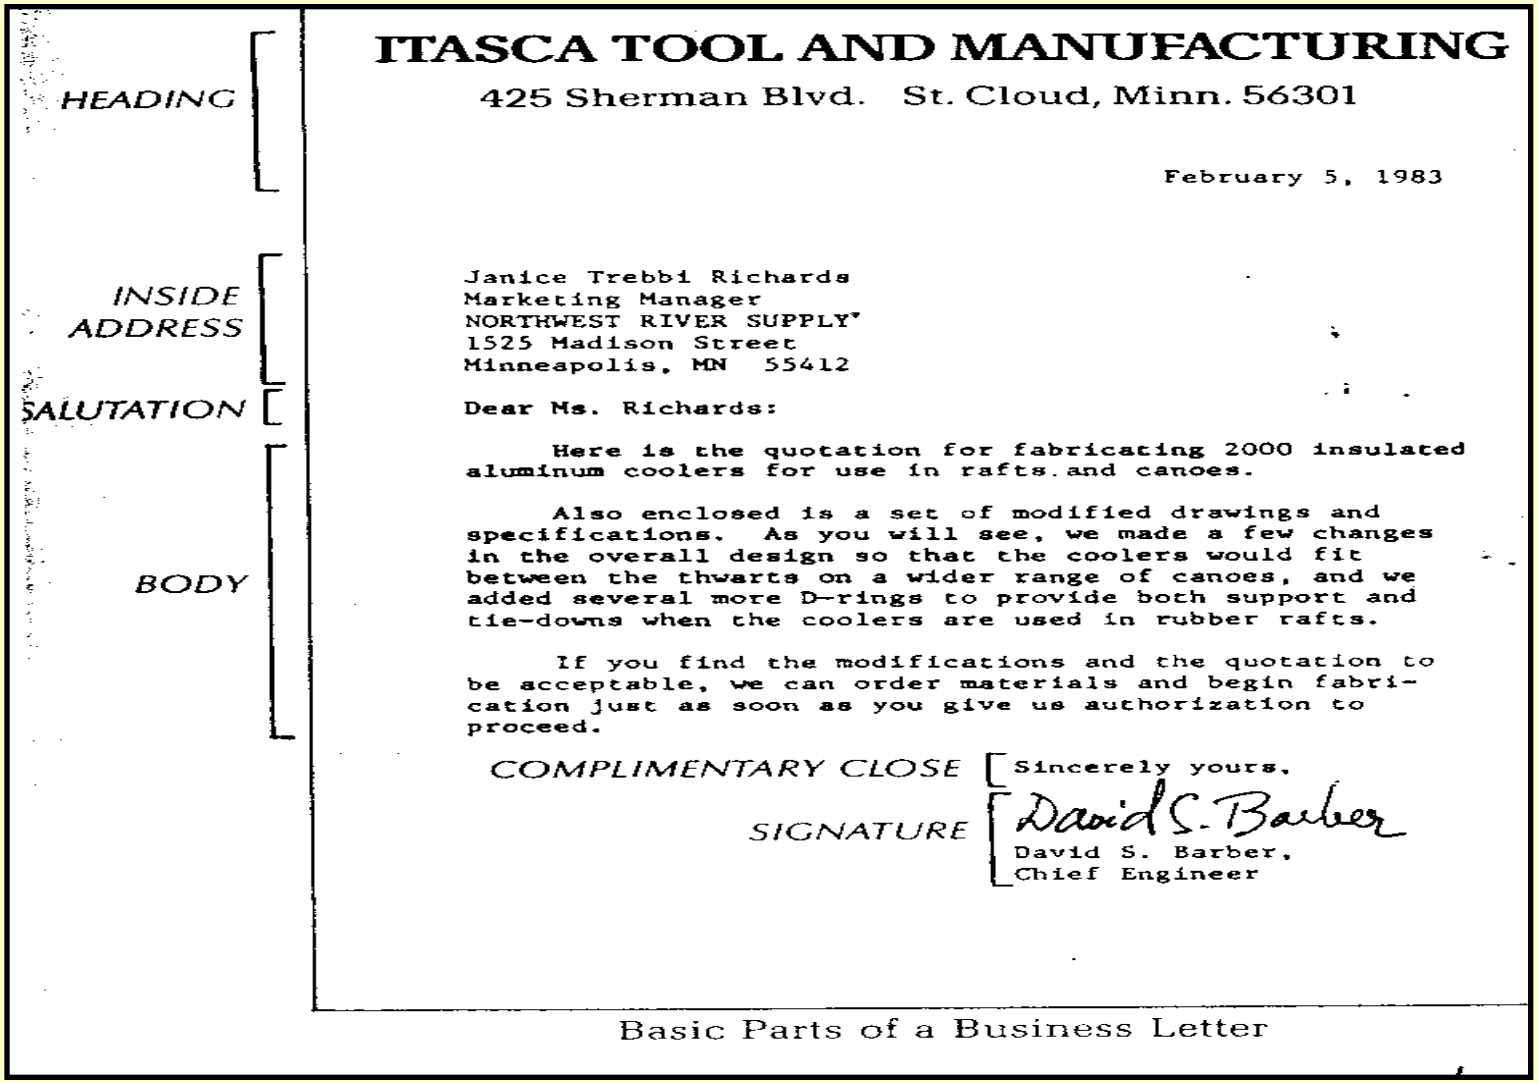

Very truly yours,
SCIENCE ASSOCIATES PUBLISHERS

Representative Letterhead Letter

Basic Parts of a Business Letter

4479 Citrus Drive
Crystal River, FL 32629
January 17, 1984

Heart of Dixie Arms
425 South Halsted Street
Albany, GA 31701

Gentlemen:

Last fall, I purchased one of your new Litearm .36 calibre muzzle loaders for turkey hunting. I had excellent service from the gun last fall, but now I am experiencing some difficulties with the set trigger mechanism. About half the time the rear trigger won't set the front one, and even when it does, the front trigger won't always release the hammer.

Have you had similar complaints from other Litearm .36 owners? Is there something I can do myself to correct the problem? If not, should I return the trigger and lock mechanism to your factory, or should I return the whole rifle?

I don't have a pressing need to get the problem taken care of immediately, but I would like to be able to use my rifle for some varmint shooting in March. Can you let me know how best to proceed?

Sincerely yours,

Elmer K. Roberts

Elmer K. Roberts

Representative Nonletterhead Letter

External Publications

- Sale, marketing and promotional literature.
- Manuals, handbooks and parts of books.
- Reports of research information.
- Corporate financial reports.

Internal Documents

- Routine project reports.
- Management decision-making documents.
- Personnel documents and policy and procedure manuals.
- Archival data reports.

The People Who Write

- Supervisors, Managers and Executives.
- Technical Experts.
- Researchers.
- Technicians.
- Professional Writers and Editors.

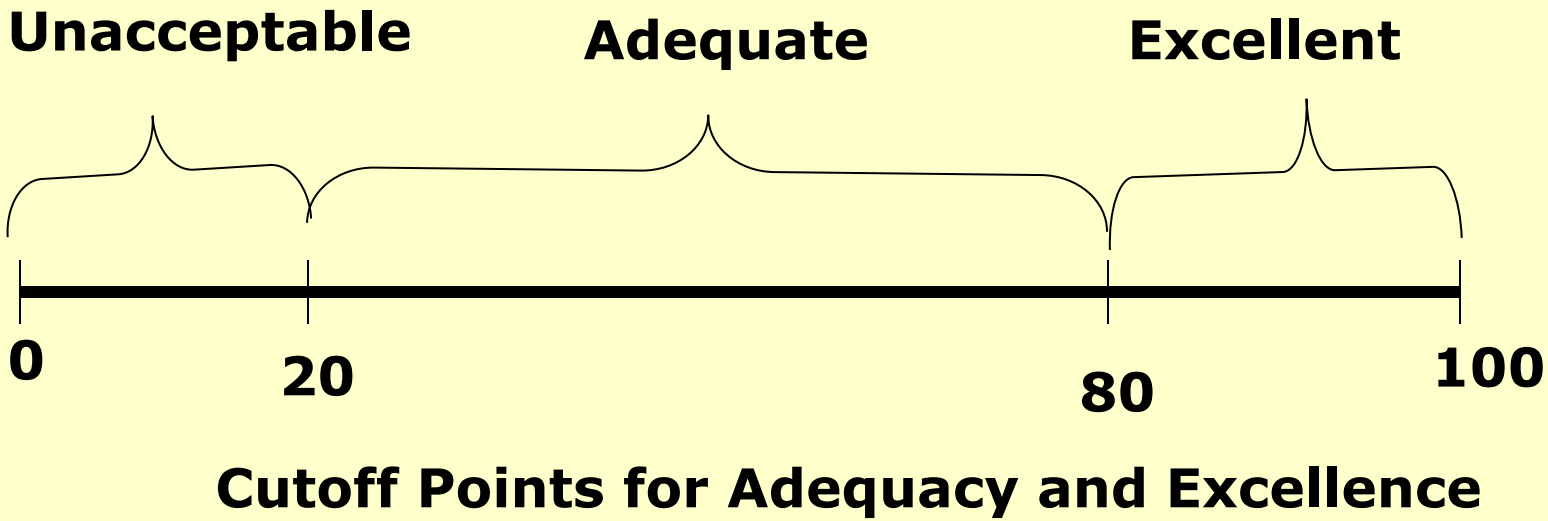

2. Adequacy and Excellence

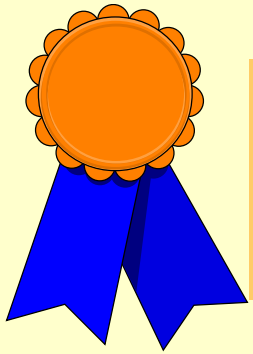

- Quality in writing, or effectiveness in writing communication is a continuous variable, from horrible to magnificent, from useless to maximally effective.
- Based on quality/effectiveness, three distinct categories of writing are classified:

1. Excellent Technical Writing.
2. Adequate Technical Writing.
3. Unacceptable Technical Writing.

The Continuum of Writing Quality

Excellent Technical Writing

- The kind of writing that will gain points for you in on-the-job situation.
- The kind of writing that will lead to raises, promotions and other recognition of excellence of your work.
- The kind of writing that will consistently get your recommendations accepted, your proposals funded, and your report praised.

Adequate Technical Writing

- The kind of writing that will keep from embarrassing you in on-the-job situations.
- The kind of writing that will be accepted and passed on, largely without comment.
- The kind of writing that won't hurt you but won't help you.

Unacceptable Technical Writing

- The kind of writing that you will get back to do over again until it's right.
- The kind of writing that will clamp a ceiling on all your other technical skills.
- The kind of writing that will be a constant impediment to your professional growth.

Criteria for Adequacy

For a report or other piece of technical writing to be judged adequate, it must be:

- **Useful**: Direct towards the problem and the solution.
- **Accurate**: Information must be sound reliable and valid.
- **Complete**: It must touch all the bases, leave no steps or data and tell the whole truth.
- **Orderly**: It must follow the accepted conventions of organization.
- **Correct**: It must be essentially free from the common errors of grammar, writing mechanics and usage.

Checklist for Adequacy

FORMAT

_____ Assignment cover sheet is present and properly formated.
_____ Design criteria are specified (see Chapter 3).
_____ Elements of formal reports are present and properly located (see Chapter 4).
_____ Plain, opaque white paper is used.
_____ Top, bottom, and side margins are proper on every page.
_____ Page numbers are present and proper (see Chapter 6).
_____ Headings and subheads are present and proper (see Chapter 6).
_____ The paper has sufficient figures and/or tables (see Chapter 8).
_____ Captions, callouts and references are proper (see Chapter 8).
_____ Bibliographic references are proper (see Chapter 9).
_____ _____
_____ _____

ORGANIZATION (See appropriate chapters in Part Four)

_____ All necessary sections are present.
_____ Sections and subsections are in the proper order.
_____ Sections and subsections are properly balanced (see Chapter 5).
_____ Sections and subsections are organized internally (see Chapter 5).
_____ The paper follows the general outline for the type of writing it is.
_____ _____
_____ _____

USAGE AND MECHANICS (See Chapter 7)

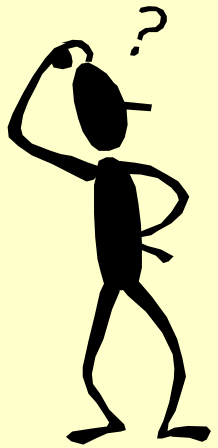

_____ Each page is free from spelling and typographical errors.
_____ Each page is free from problems with major punctuation.
_____ Each page is free from problems with minor punctuation.
_____ Abbreviations and symbols follow conventions.
_____ Capitalization follows conventions.
_____ Underlining and italics follow conventions.
_____ All verbs agree with their corresponding subjects.
_____ All pronouns agree with their corresponding antecedents.
_____ Headings, subheads, and listed items are grammatically parallel.
_____ No false parallelism exists.
_____ The paper is free from dangling modifiers.
_____ The paper is free from sentence fragments.
_____ _____
_____ _____

BASIC WRITING STYLE

_____ Paper addresses a real(istic) problem.
_____ Paper contributes to the solution of the problem.
_____ Paper is free from strings of choppy sentences.
_____ Paper is free from excessively awkward constructions.
_____ Paper is direct in style and approach.
_____ Paper contains no unnecessary sections or subsections.
_____ _____ 112

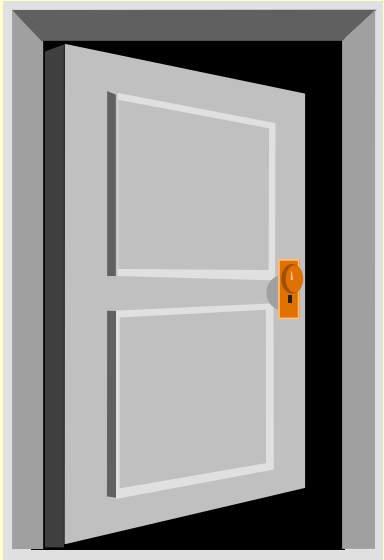

Levels of Adequacy

- It is adequate in every respect.
- It is more than adequate in some respect.
- It is brief.
- It is smooth.
- It is direct.

Criteria for Excellence

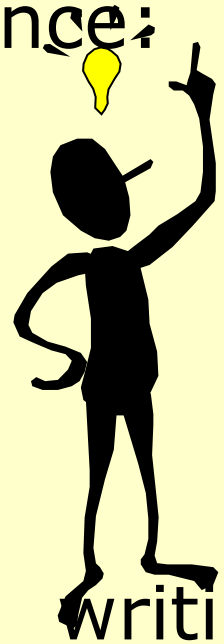

- Adequate in every respect.
- More than adequate in some respect.
- Brief, smooth and direct.
- Easy to read.
- Interesting to read.
- Easy to remember.

The Demands for Excellence

The situation that demand excellence:

- **Large audiences.**
- **Important audiences.**
- **Safety precautions.**
- **Money involved.**
- **Reputations.**

The importance of a piece of writing comes from the size and nature of the readers and the nature of the information to be communicated.

Achieving Adequacy and Achieving Excellence

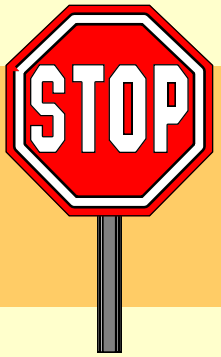

Three observations must be kept in mind:

1. Anyone can produce an adequate written communication.
2. If you start with adequate written communication and keep improving it, sooner or later it will be excellent.
3. Adequacy can be achieved by following the rules, but to achieve excellence you must be willing to experiment, to try new things, to accept new ideas, to suspend disbelief and to risk traveling where the charts are poor.

The road to excellence is a long one and there is no shortcuts, but the route is well marked. Here are some salient signposts:

- Start with an adequate report. (don't strive for excellence)
- Analyze your own personal writing style. (weakness and strengths)
- Concentrate on your paragraphs. (construct them soundly and develop them fully)
- Focus on your clauses and sentences. (communicate effectively)
- Incorporate cohesive devices into your writing. (make it hang together)
- Improve your diction. (choose words that are familiar, direct, concrete and specific)

Remember

- Don’t strive for excellence on the first jump.
- Don’t be disappointed if you don’t achieve excellence on the first papers you submit.
- Build a sound foundation of adequate writing and then improve the best of your writing through successive revision until you have achieved the excellence you seek.

3. Analyzing the Communication Context

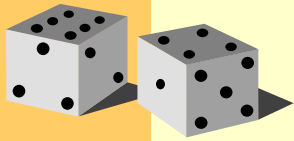

- You can't design and write a report without knowing who your audience will be and to what use your information will be put.
- To begin your analysis, you must formulate answers to some of the classic questions of journalistic writing: **WHO***?*, **WHY***?* and **WHAT***?*
- You must specify **audience**, **purpose** and **type of information**.

Varieties of Audience for Technical Communication

- **Executives and Administrators** (Responsible for policy formulation and the decision-making associated with implementing policy).
- **Technical Experts** (People with advanced degrees and several years of experience in a field of discipline).
- **Technicians** (Installers, operators of equipment, repairmen, lab technicians and assistants, draftsmen, clerical support people, foremen).
- **Laypeople** (Anyone who lacks expertise in your field).
- **Combined Audience** (consist of two or more of these groups).

The Many Faces of Purpose

"***Why am I sitting down to write?" you must ask yourself.***

- You are writing to communicate technical information that someone else needs. Your purpose in writing, then, is your reader's purpose. Your goal is to meet your reader's needs.
- Since you have multiple and disparate reader, you will have multiple and disparate purpose. (primary, secondary and tertiary Purposes).

Consider the several writing purposes that might be associated with a recommendation report you submit to top management in your firm:

- You want to convince the decision-making to accept your recommendation.

- You want to convince the technical experts that you indeed know what you're talking about.

- You want to convince your immediate superior that your work is sound and that you possess skills that merit recognition and promotion.

•You want to save the time for the administrators and executives (because time is money).

• You want to save time for yourself (because there are things you would rather do than write reports).

Purpose Analysis

You should be able to identify and specify the following purposes:

The primary purpose your major audience segment has for reading.

Any secondary purpose for reading that this group might have.

Primary and secondary purposes minor audience segments might have.

The ostensible and the real purpose of you communication (if they are different).

- The secondary purpose in communication that benefit you firm or organization.

- Any personal purpose or goals you might have that do not conflict with the more direct purpose of your writing.

Types of Technical Information

- Avoid putting different kinds of information or information about different subjects in a single report; instead write separate reports.
- Keep in mind that a report isn't a sink for you to dump all the information you happen to have into.
- Don't tell readers things they already know.
- Don't tell readers things that they don't need to know.
- Don't tell readers things they don't care about knowing.

- Stick to the point.
- Don’t try to make a report or a letter or a memo serve double duty.
- Don’t ask someone for a favor and then thank him or her for it in the same memo.
- Don’t put details about several different projects in the same memo.
- Avoid combining temporary, transient information and primary or long-lived data in the same document.
- Give heed.

The Report Design Worksheet

Your tasks in analyzing the communication context are:

- To **identify** the various segments of your audience and record certain information about these readers.
- To **identify** your various communicative purposes and arrange them in some order or priority.
- To **document** your analysis so that you have it available for reference.

Report Design Worksheet

- **Preliminary Information:**

What is to be done?----------

Who is it to be presented to and when?----------

Restrictions (format, length, etc.) ----------

- **Readers Analysis:**

Audience: immediate Secondary Primary

Position or title:----------

Relationship to author:----------

Technical expertise:----------

Attitude towards subject:----------

Effect of report on:----------

readers and organization:----------

-

Personal characteristics:----------

-

- **Readers Purpose:**

Why will he read the report?----------

What should he know and able to do after reading the report?----------

- **Writer's Purpose:**

Desired effect(s) of the report:----------

Types of Audiences:

- **Primary Audience:**

Consists of the people directly affected by the information you convey.

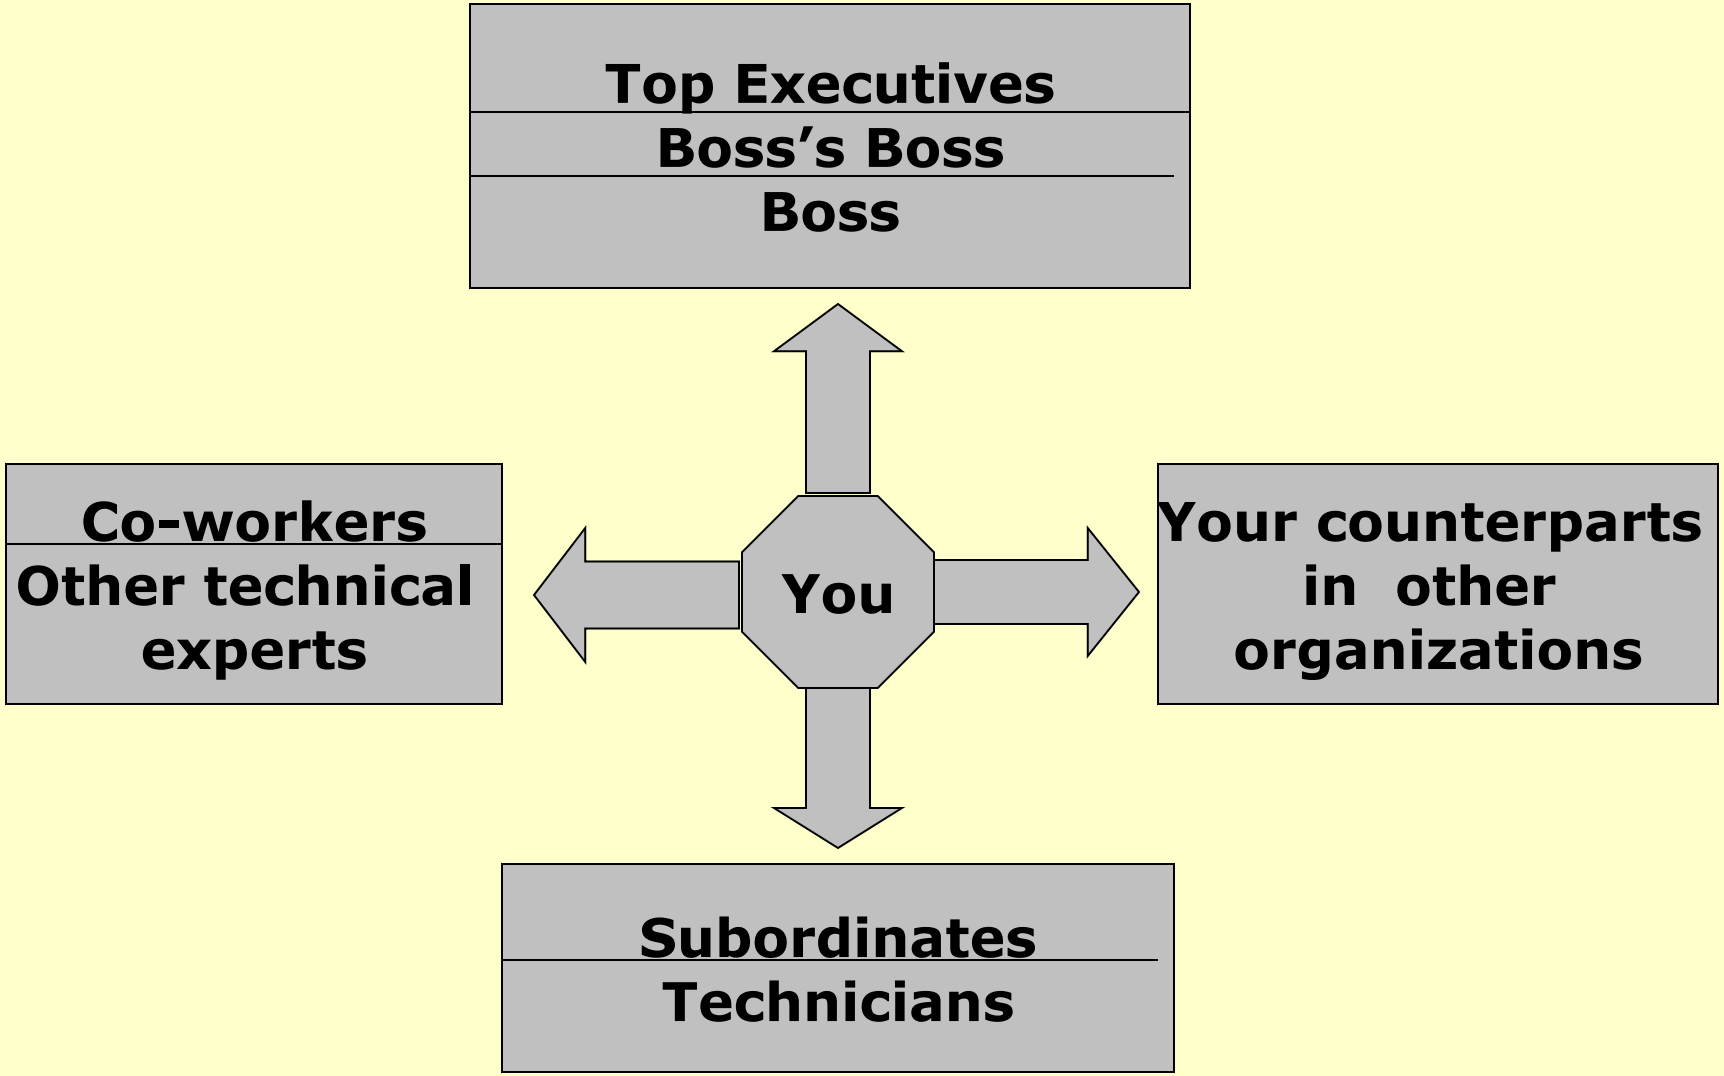

- **Secondary Audience:**

Consists of the people indirectly affected by your information.

- **Immediate Audience:**

Is the person to whom you deliver your written document and through whom you transmit it to your primary and secondary audiences.

The Flow of Information in Organizations

Developing Design Criteria

- **The key parameters of analysis are:**

1. Audience.
2. Purpose.
3. Type of information.
4. Vectors of information flow.

These parameters combined to give you design specifications for such variables as:

- The basic type of report you will write.
- The amount and type of information that will go in the main body of your report and in appendixes.
- The level of language you will use.
- The style of writing you will use.
- The illustrations and other graphic material you will use.
- The degree of revision and final polishing you will give to our report.
- The number of copies of our report you will generate and the distribution list for them.

4. Correctness in Usage and Mechanics

- One of the characteristics of an acceptable report or any other piece of technical writing is that it is essentially correct in grammar, mechanics and usage.
- An acceptable report is essentially free from the common errors and mistakes.

Editing for Correctness

You have to find mistakes before you can correct them (spotting errors).

- **For good editing of your technical writing, here are some things you can do:**

1. Acknowledge the fact that you have difficulty with correctness in your writing.
2. Accept the fact that you are going to have to spend extra time and effort overcoming your difficulties.

3. Systematically identify the particular problem that you experience (make a list).
4. With each paper that you write use your list of problems as an editing guide.
5. Work through your paper from back to front. Read each sentence word-for-word backward *"One of the biggest problems with editing for correctness is seeing what your mind knows should be on the paper rather than what actually is on the paper."*

6. Take advantage of informal reviews.
7. Whenever you make changes in a paper, recheck for correctness.
8. Don’t overlook the value of final checking and final polishing, put your paper a side for a day or two and then come back to it fresh.

Common Problems with Grammar

1. Subject-Verb Agreement:

Singular subjects go with singular verbs and plural subjects go with plural verbs.

- **Wrong***:* Jack and Jill, Jill being the smarter of the twins, **is** coming to the party later on.
- **Right***:* Jack and Jill, Jill being the smarter of the twins, **are** coming to the party later on.
- **Wrong**: Jack, together with Jill, **are** coming to the party later on.
- **Right**: Jack, together with Jill, **is** coming to the party later on.

2. Pronoun-Antecedent Agreement:

Wrong: Each of the soldiers must clean **their** own rifle.

Right: Each of the soldiers must clean **his** own rifle.

Wrong: None of the birds fell out of **their** nest.

Right: None of the birds fell out of **its** nest.

Wrong: Everybody brings **their** books tomorrow.

Right: Everybody brings **his** books tomorrow.

3. Grammatical Parallelism:

Items in lists and successive headings and subheads should be treated/expressed in grammatically parallel form.

Wrong: Sort**ing** the cards. Check to see that the machine is on. Load**ing** the deck. Clear the jam.

Right: **Sort** the cards. **Check** to see that the machine is on. **Load** the deck. **Clear** the jam.

Right: Sort**ing** the cards. Check**ing** to see that the machine is on. Load**ing** the deck. Clear**ing** the jam.

Wrong: John likes **dancing** and to **go** to parties.

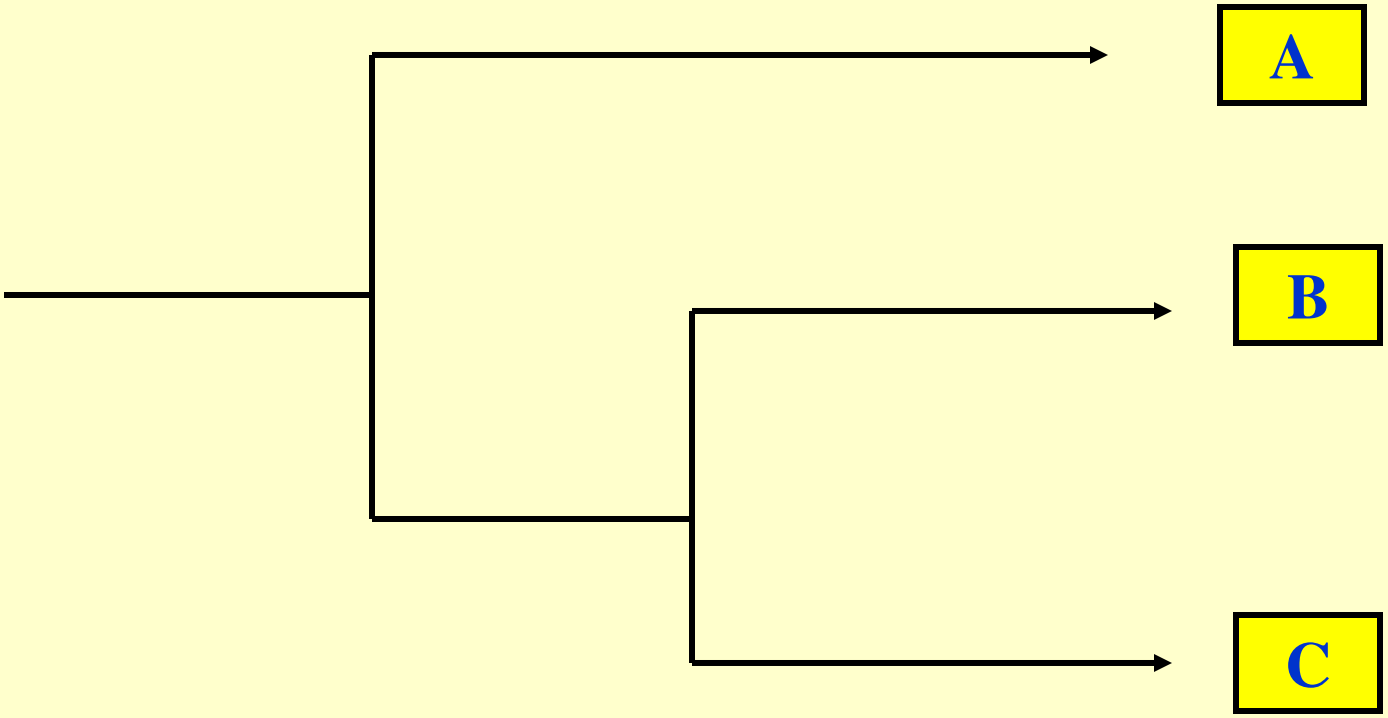

Right: John likes **dancing** and **going** to parties.

Right: John likes to **dance** and to **go** to parties.

Wrong: The stove consists of the base, fuel tank, burner, and **the** windscreen.

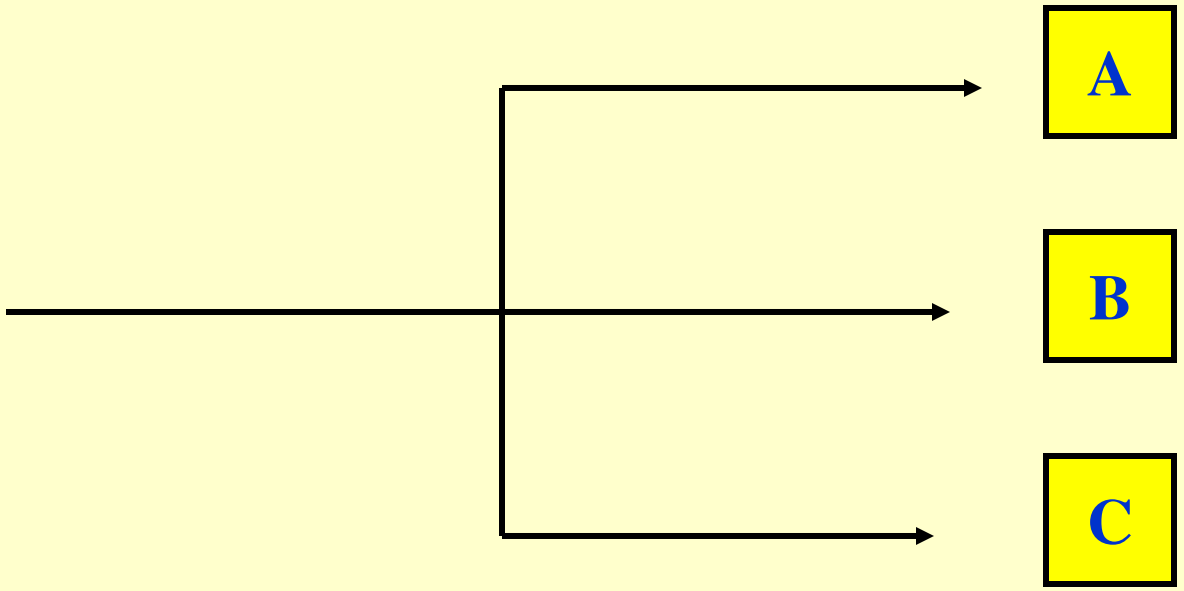

Right: The stove consists of **the** base, **the** fuel tank, **the** burner, and **the** windscreen.

Right: The stove consists of **the** base, fuel tank, burner, and windscreen.

A and (B and C)

One item parallel to two others

A, B, and C

Three items parallel to one another

Wrong: Aspirin substitutes are effective, safe **and** they don't upset your stomach.

Right: Aspirin substitutes are effective **and safe** and they don't upset your stomach.

Wrong: John cleared the table, washed the dishes, **and** then he straightened up the living room.

Right: John cleared the table **and** washed the dishes, **and** then he straightened up the living room.

4. Sentence Fragments:

Wrong: Harold went to the hardware store**. And** to the drug store.

Right: Harold went to the hardware store **and** to the drug store.

Wrong: The control rod jammed and allowed the cable to snarl**. A**lthough the entire setup had been checked thoroughly.

Right: The control rod jammed and allowed the cable to snarl**, a**lthough the entire setup had been checked thoroughly.

Common Problems with Punctuation

End punctuation with sentences:

Wrong: Can you have the report on my desk by noon tomorrow**.**

Right: Can you have the report on my desk by noon tomorrow**?**

Wrong: The bill was from ARCO Engineering, Inc**..**

Right: The bill was from ARCO Engineering, Inc**.**

- *Introductory Subordinate Clauses:*

Because she was happy, Helen smiled.

Next, let us consider the entropy of the system.

Being happy, Helen smiled.

- *Interruptive Elements: ( ) - - , ,*

Right: Jack **(**the man in the front row**)** gave me the free tickets.

Right: Jack **-**the man in the front row**-** gave me the free tickets.

Right: Jake**,** the man in the front row**,** gave me the free tickets.

Wrong: The fat man, who owns the sports car played the tuba in the band.

Wrong: The fat man who owns the sports car, played the tuba in the band.

Right: I got the free tickets from Jack**-** the man in the front row.

Right: I got the free tickets from Jack**,** the man in the front row.

Right: I got the free tickets from Jack **(**the man in the front row**)**.

Minor Problems with Punctuation

- *Possessive Apostrophes:*

Wrong:	**Right:**
Johns hat	John’s hat
The cats tail	The cat’s tail
The bridges rail	The bridge’s rail
The experiments results	The experiment’s results

- *Introducing Lists:*

Wrong: The main parts of a computer are**;** the central processor, the memory, and the input/output devices.

Right: The main parts of a computer are**:** the central processor, the memory, and the input/output devices.

Wrong: Dear Mr. Johnson**;**

Right: Dear Mr. Johnson**:**

- ***Using Quotation Marks With Other Punctuation:***

Wrong: It was the Boise River-**"** River of the woods**".**

Right: It was the Boise River-**"** River of the woods**."**

Wrong: Smith. H.R. **"** Rotating Crops in Arid Land**",** Applied Agronomy, 22:4 (1982), 15-22.

Right: Smith. H.R. **"** Rotating Crops in Arid Land**,"** Applied Agronomy, 22:4 (1982), 15-22.

Conventions with Mechanics

- **Abbreviations and Symbols:**

1. Use the dollar sign ($) and pound sign (£) in running text ($14 rather than 14 dollars).
2. Use the percent symbol (%) if you are reporting a good many percentages.
3. Use the degree symbol (º) (20º C, 35º F).
4. Use the ampersand (&) when it is part of corporate name (John Wiley & Sons, Inc.) otherwise write and.
5. Use the "less than"/ "more than" (P ><0.05).

6. Use abbreviations for common organization (FBI, WHO, UNISCO, USA, UK).
7. Use the following common abbreviations freely: AC and DC, AD and BC, AM and FM, A.M. and P.M., UHF, VHF and TNT etc.
8. Use abbreviations for Latin expressions used commonly in English (etc., e.g., i.e., Vs and viz.).
9. Use abbreviations for common derived Units (rpm, dpi).
10. Use other abbreviations only if what you are abbreviating is long and often used.

- **Numbers and Numerals:**

The convention for numbers is simple, Spell out numbers one through nine and use numerals for numbers 10 and above. However, there are some exceptions:

1. Always spell out number at the beginning of a sentence.

Example: Thirty-seven people came to the party rather than 37 people came to the party**.**

2. Use numerals for street addresses, dates and sums of money.

Example: 3568 Park Avenue South

March 9, 1995

$ 4.53, $5.00

3. Use numerals for mixed numbers below ten, but spell out fraction that stands alone.

Example: (3 ½, 5.375, 7 ¾)

Example: (Three-Fourths of the money, half of the membership).

4. Use numerals for decimal fractions.
Example: (0.025. 0.56, 0.5)

5. Use a hyphen between the number and the unit for capacities and dimensions.

Example: 55-gallon barrel
250-ml flask
Four-foot doorway

- *Italics and Underlining: (Italics is equivalent to underlining)*

1. Always underline the Latin names of genera and species of plants and animals.

2. Always underline the title of books, journals, magazines and newspapers (but not the articles in them).

3. Underlining foreign words unless they are so common (resume, versus).

4. Don’t underline the following abbreviations: e.g., i.e., Vs., etc., Viz.

5. Title of books, journals, magazines and newspapers, stressed words and foreign words are set in italic type.

5. Report Forms and Formats

- The term *report* broadly refers to a variety of written documents-including proposals, literature reviews and state-of-art-papers, instructions, procedures manual, environmental impact statements, and even certain types of magazines and journal articles.
- Any system of classifying types of reports has to consider both ***what a report looks like*** **and** ***what a report does***.

Variation in Report Form and Format

- **The Fill-in-the-Blank Reports.**
- **The Letters and Memos.**
- **The Formal Report.**

The Fill-in-the- Blank Reports

- The fill-in-the-blank report starts with a blank form.
- Your job as a writer, basically, is to fill in the blanks.
- They are used widely in business and industry for monthly summaries, inspection and travel reports, and other often repeated kinds of communication.
- They are generally used for numerical information.

The Letters and Memos

- Many reports are published in the form of a letter or memo.
- Such reports are typically short (1-5 pages).
- It may have headings and subheads, but often doesn't.
- It may have tables and figures but usually doesn't.

TO: Branch/Area Managers and Loan Officers
FROM: Credit Administration
SUBJECT: SBA POLICIES

The Small Business Administration has clarified its policies in the enclosed memorandum dated February 24, 1982 (enclosure #1). As noted, the SBA allows the servicing lender discretionary authority to modify certain conditions and parameters contained within the original approval.

Effective immediately, the loan officer responsible for servicing an SBA loan has the authority to modify original conditions *only if* the original loan amount falls within the loan officer's discretionary lending limit. Any modification must be outlined in written memorandum form and placed for permanent keeping within the credit file.

If the original loan amount exceeded the loan officer's lending limit, then modifications must be approved by the person or committee which approved the original transaction. Such approval must be in written form, and the reason or rationale for any modification must be explained in full detail.

It is expected that modifications or changes from original conditions will be a rarity. Remember that the original parameters were put in place for good and sound reasons, therefore, any change must be fully supported.

FROM: Personnel
SUBJECT: PAY FOR TRAINING

Non-exempt employees will be paid wages for attendance at training/educational events during non-working hours *only if attendance is approved and required by the bank*. Pay is not to be granted for after-hours training which employees are encouraged to attend in order to improve their job skills and/or potential. Please contact the Personnel Department if you are uncertain whether attendance at a particular training event should be paid.

This policy addresses only the payment of salary/wages for after-hours training; it does *not* apply to or affect the current policy regarding reimbursement for tuition or other costs of education or training.

Representative Letter and Memo Reports

The Formal Report

There are certain components or elements, that must be present in a report for it be called formal. We can divide these parts into two groups :

1. Front Matter:

- **Cover letter.**
- **Cover (optional).**
- **Title page.**
- **Table of contents.**
- **List of illustrations (optional).**
- **List of definitions, abbreviations and symbols (optional).**
- **Summary/Abstract.**

2. Back Matter:

- **Bibliography.**
- **Appendixes.**
- **Index (optional).**

Front Matter

1. ***Cover letter*:** (memo letter or letter of transmittal). Its primary purpose is to provide the writer with a vehicle for saying things to some members of his audience.
2. ***Cover:*** Longish reports are usually distributed with a cover. It serves to identify (title of the report and name / address of the firm publishing the report), protect (sturdy and firmly attached to the report) and attract (colour, photographs and graphic design).

TO: Judy Tatko, President

FROM: Carrie Lee, Treasurer

SUBJECT: Information requested on Kappa Alpha Theta

DATE: March 22, 1981

Here is the information you requested regarding the current financial status of Kappa Alpha Theta. This information is complete only up to February 28th as not all of the bills have been paid for the month of March.

I hope this what you needed. Please contact me if you have any questions.

Specimen Cover Memo for a Report

3. *Title Page*: It serves to identify the report and provide all the necessary bibliographic data. In formal reports you should always include a title page, even if the report also has a cover. The items to be includes in the title page are:

- Title of the report.
- Author(s) (or editor or compiler) of the report.
- Organization (and division or section) publishing or distributing the report(with mailing address).
- Date of publishing or issuing of the report.
- Form number, order number etc. of the report (if any).
- Person (or firm) for whom the report was prepared.
- Copyright, distribution, or classification data.

Title Page of a Formal Report

4. ***Table of contents*****:** It is appropriate for reports of 15 to 20 pages or longer. It should include lists of all chapters, section headings as a minimum.

5. ***List of illustrations*****:** It is useful in reports if the illustrative or tabular data are such that readers may want to access to them independent of the report main text.

6. ***List of definitions, abbreviations and symbols*****:** It is best to avoid obscure terminology and unusual symbols in the report. If you use few symbols, it is best to explain them at the point you first use them.

7. *Summary/Abstract*: (an introductory summary). It is a component of formal or semiformal reports that is designed to give busy administrators, executives, or decision-makers the gist of a report. It should represent your clearest and most effective writing.

EXECUTIVE SUMMARY

Brown's Interiors of Kansas City will design, provide, and install six interior window coverings needed in Myklebust's Men's Apparel for a cost of $1260.00. Myklebust's is in need of aesthetically pleasing window coverings that will efficiently block sunlight entering the store late in the afternoon. In this proposal, Brown's describes the most effective window coverings, outlines its design and installation techniques, presents a timetable for the services to be provided, and presents the firm's past experience and credentials. Brown's Interiors is pleased to present this proposal and is looking forward to providing Myklebust's with the finest of professional interior design services available in the area.

Representative Executive Summary

Back Matter

1. ***Bibliography*** **(*References*):** it is a list of complete reference citation for all the documents you refer to in the report. Additional documents that your reader might find useful may be added.
2. ***Appendixes*:** Information that is vital for your primary audience must go in the main body of the report. Almost anything else is candidate for inclusion as an appendix.(calculations, derivations, resume, list of clients, detailed tables, copies of research, analysis, etc.).
3. ***Index***: Index are used primarily in manuals or data reports that are likely to be used as reference documents. There use is limited to longish documents.

APPENDIX B

CALCULATION OF CAPITALIZED COST

Capitalized cost is a method to economically compare alternatives that Procter and Gamble uses for this type of project. This method gives a total cost for a piece of equipment which permits it to be perpetually replaced when its service life is over.

To calculate capitalized cost, use Equation (1):

$$K = Cv + \frac{Cr}{(1+i)^n - 1} \qquad \text{Equation (1)}$$

where K = capitalized cost
Cv = original cost of the equipment
Cr = replacement cost of the equipment
i = interest rate
n = length of service life in years

The replacement cost is computed by Equation (2):

$$Cr = Cv - Vs \qquad \text{Equation (2)}$$

where Vs = salvage value of the equipment.

For the scraped-wall exchanger, the service life is estimated to be eight years and the salvage value $2500. Original cost of 1000 square feet of heat exchange surface is $22,000. Substituting these values and an annual interest rate of 0.30 into Equations (1) and (2) gives:

$$K = 22000 + \frac{(22000 - 2500)}{(1+0.3)^8 - 1} = \$24,724 \approx \$24,800$$

Likewise, for falling-film exchanger of 1000 square feet of area and n = 9, Cv = 14,000, Vs = 1500:

$$K = 14000 + \frac{(14000 - 1500)}{(1+0.3)^9 - 1} = \$15,301 \approx \$15,300$$

Page Numbering in a Formal Report

- First page in the main text should be page 1. Use lower case Roman numerical for pages of front matter (i, iv, vi, etc.).
- Don’t put a page number on your title page but reserve a number for it.
- Pagination of back matter may be done as continuation to the main text throughout bibliography, appendixes and index.
- More often appendix pages are given a letter + number designation (A-1, A-2, A-3).

- Bibliography and index may be included in the last two appendixes.
- If the appendix is a reprint of a document with its own page numbers , put your own numbers in square brackets either above or below the original ones.

Semi-Formal Reports

- Semi-Formal report is best regarded as a formal report with something missing.
- You don’t always need bibliography, appendixes, cover letter.
- The majority of the reports written in on the job fall into the semi-formal reports category.

Variation in Report Function

There are only three things you can report on:

(1) The status of a **project** you are accountable for.

(2) Certain **activities** you have been engaged in.

(3) **Data** you have been asked to gather or generate.

- Major functional varieties of report (in term of the kind of information) are:

1. Project Reports.
2. Activities Reports.
3. Reference Data Reports.
4. Management Reports.

Project Reports

- They are the fuel of the project machine.
- Such reports focus on things that have been done.
- They are read mainly by administrator to (1) keep current on the status of work in their departments, (2) to estimate future work loads and personnel needs and (3) prepare higher-level management reports.
- Some common report labels that fall in the project report category are: (Progress Reports, (2) Status reports and (3) weekly, monthly and quarterly reports.

Activities Reports

- Unless you're self-employed, you will be asked on a regular basis to report how you spent your time during the month (week, year) immediately past.
- Travel, inspection, training programs, tours are activities to report.
- Your immediate supervisor will read you activity report to estimate future work loads and personnel needs and to evaluate you and assess your performance.
- Example: Monthly activities reports, Travel reports, Traffic accident reports and conference reports.

Reference Data Reports

- Reference data report is a report that reports presents data gathered and generated by someone and that is used by others for some references.

- Journal article is a good model for reporting data you have generated.

Management Reports

- Most of the reports and other documents in on-the-job situation will be management reports of one kind or another.
- Project reports and activities reports are in a very real sense, management reports.
- Proposals, feasibility reports, recommendations, resumes are also fall in this class.
- Such data is used for management decision-making purposes.

6. Report Writing Procedures

There are five phases involved in putting a report together, two are before the actual writing begins:

1. **Data gathering.**
2. **Preliminary organization.**

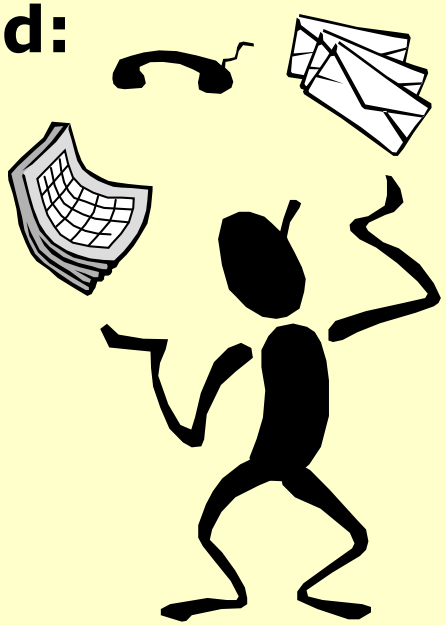

and three involve the actual writing itself:

3. **Initial draft preparation.**
4. **Revision.**
5. **Final inspection**.

Data Gathering

Four methods of obtaining data and information may be followed:

- Direct observation.
- Testing and experimentation.
- Consultation and interview.
- Library research.

Preliminary Organization

The goal of organizing the report is to make it easy for the readers to get the information out of the report. Never write a report in such a way that your audience has to read all the way through it just to find out if it contains the information he needs.

There are three essential characteristics of good organization or of things that are organized:

- All related items are together in one place.
- All unrelated items are separated.
- Packages of related items are clearly labeled.

How to Achieve Sound Organization

- Perform a detailed communication context analysis and write out your analysis.
- Specify the information that you might include in the report.
- Gather related items of information together.
- Separate out unrelated items of information.
- Consider all the items of information in each shoebox.
- Think of some appropriate labels to put on each of the shoebox.
- Go through the content of each box and generate some subcategories of information.

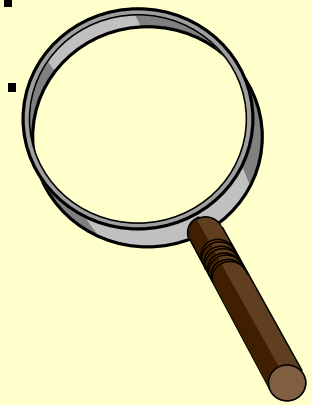

Initial Draft Preparation

- The main job in this stage is just getting the ideas into words, without worrying about form or style, keeping in mind that you will rewrite everything.
- Don’t start with your introduction. It is the hardest thing to write and the most important.
- Start with the easiest section first-the section you know the most about.
- Writing should be rapid.
- Don’t allow yourself to stop and polish your writing (form and style).

Revision

- Revision is the most important factor that separates good writers from poor writers.
- Never do revision soon after finishing the initial draft writing, instead give yourself a day or two.
- Major phases of revision may be:
- Reorganization (entire paper or some sections).
- Restructuring sentences (grammar, spelling, punctuation, smoothness and word choice).
- Adding or deleting large blocks or sections.
- Graphic and illustration.
- Writing style.

REVISION CHECKLIST

___ Each page is free from spelling and typographical errors.

___ Each page is free from dangling or misplaced modifiers.

___ All subjects agree with their corresponding verbs; all pronouns agree with their corresponding antecedents.

___ Each page is free from errors in grammatical parallelism.

___ Each page is free from sentence fragments.

___ Each sentence has proper end punctuation.

___ All introductory phrases or clauses are set off with commas.

___ All independent clauses are joined with semicolons or comma-plus-conjunctions.

___ All interruptive elements are set off with a *pair* of commas, dashes, or parentheses.

___ All possessives have apostrophes; no plurals have apostrophes.

___ All lists are introduced with colons rather than semicolons.

___ All periods and commas that appear with quotation marks are inside the quotation marks.

___ All abbreviations and symbols follow conventions.

___ All numbers and numerals follow conventions.

___ All titles of major publications and all unassimilated foreign words and phrases are underlined.

___ Each page is free from unnecessary capitalization.

___ All figures and tables have proper captions.

___ All headings and subheads are in proper format.

___ Each page has a page number properly located and sequenced.

Final Inspection

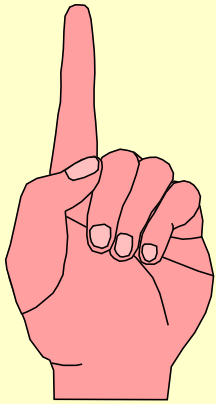

- Final inspection is necessary to any writer who hopes to turn out consistently acceptable reports.
- It occurs after the writer has his final revised manuscript redrafted or retyped and just before he sends his finally revised manuscript out for review and approval.
- Two things to be checked during this phases:

1. Errors and mistakes that might have been introduced during the final retyping.
2. Errors and mistakes that have been there all along but the writer has overlooked.

What to Check During Final Inspection

- Typographical errors.
- Misspelling of peoples' names or firms.
- Mistakes in numerical data and figures.
- Words or whole phrases missing or repeated.
- Inconsistencies in abbreviations or symbols.
- Missing page numbers or page out of order.
- Inconsistencies in terminology.
- Common errors (like its' for its, respectively for respectivelly).

7. Graphics and Illustrations

- One of the key things that characterizes technical writing and separates it from creative and expressive writing is the extent to which the writers use tables, graphs and pictures to complement their verbal communication.
- Illustrations serves to communicate information that is difficult to express verbally.
- Illustration (especially tables and graphs) serve as convenient ways to summarize large bodies of precise numeral data.

- ***Table*:** a table consist of two or more columns of precise data, usually numerical.
- ***Figure:*** Figure refer to charts, graphs, line drawing, photographs.
- ***Figure (or table) caption:*** consists of figure (or table) number and a short description.
- ***Figure (or table) reference:*** is the device used in the running text to refer the reader to an illustration.
- ***Callout:*** Identifies or calls-out a certain part of whatever is being illustrated.
- ***Legend:*** is a list of definitions or explanations of symbols or abbreviations used in an illustration.

ELECTRICAL CONNECTIONS

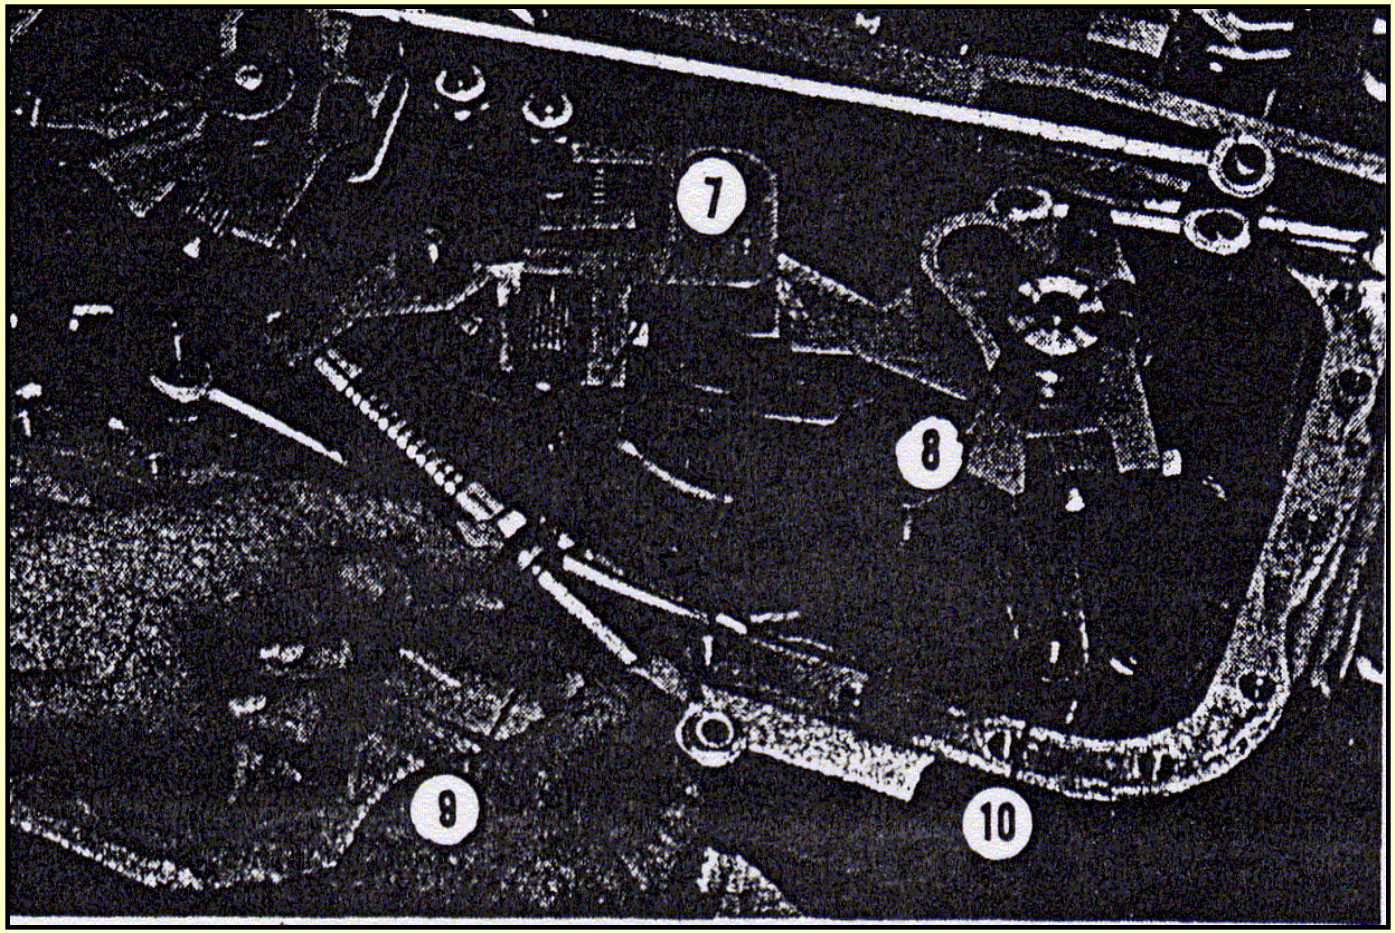

All electrical wiring must comply with local and national codes. The installer must provide a fused disconnect switch which should, for safety reasons, be installed within sight of the unit.

Bring the line wiring into the unit through one of the conduit knockouts on the lower right side of the unit (see Figure 2). Splice the line wires to the unit power leads in the main junction box (see Figure 5).

Refer to Table 2 for wire and fuse sizes.

9. Engine oil pressure indicator.
10. Alternator indicator.
11. Power (disconnect) switch.

Legend

Photographs and Line Drawing

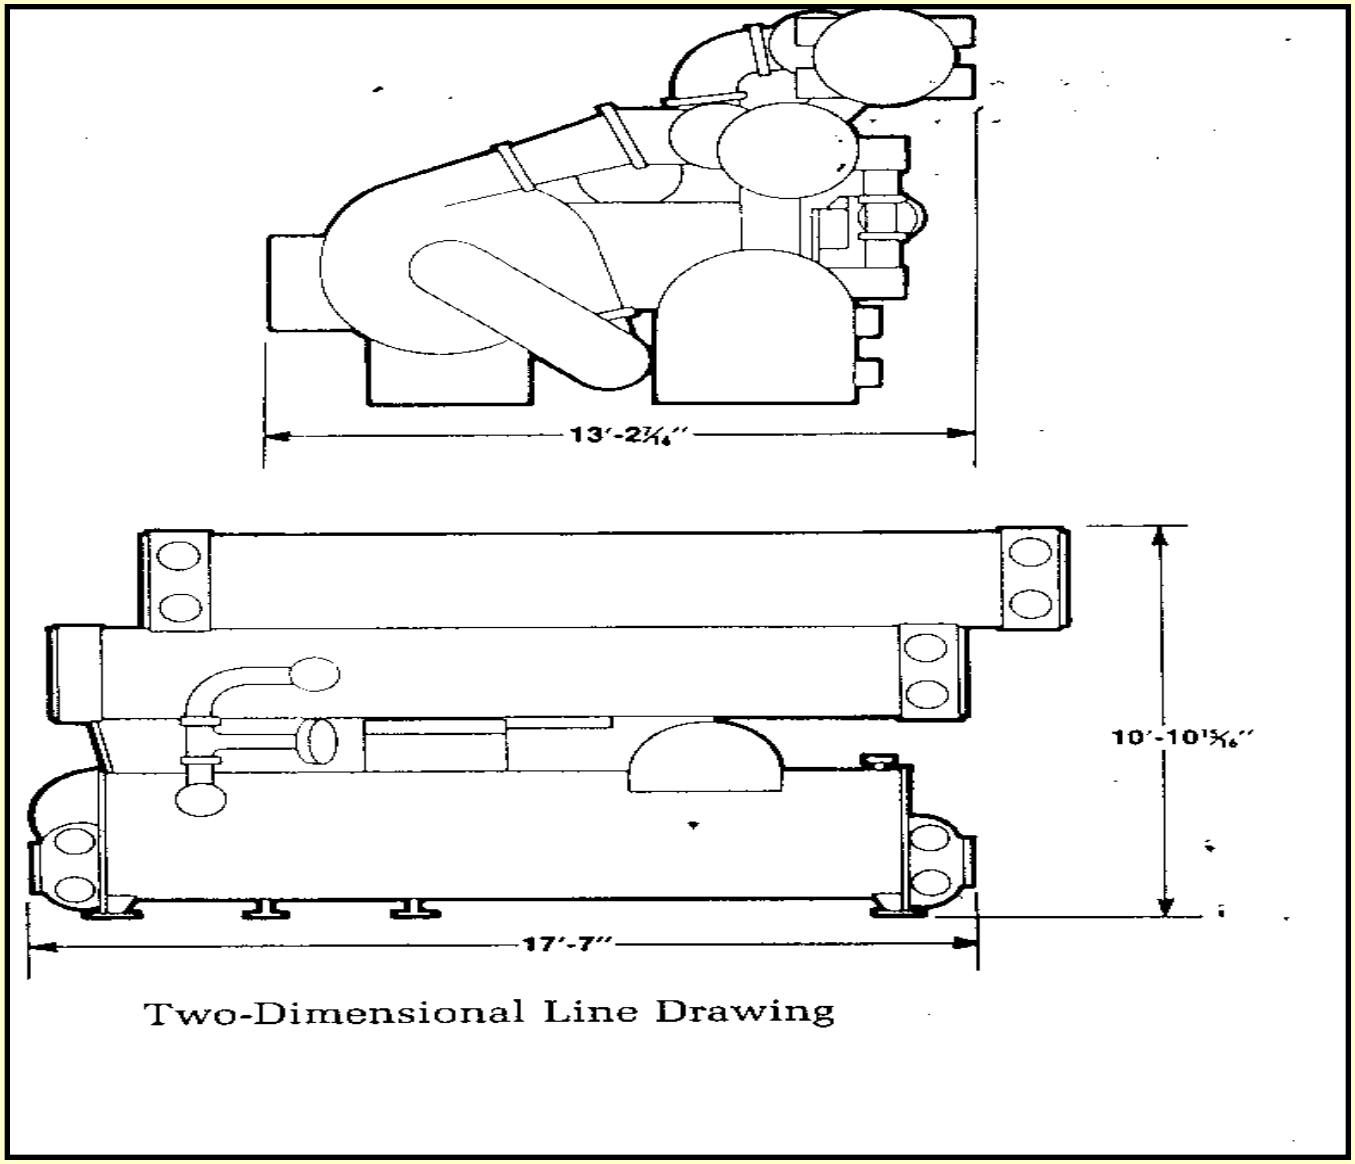

- **Photographs** are used extensively in instruction manuals, brochures, technical bulletins and other documents that are printed and distributed in large quantities.
- ***Line drawing*** have some advantage over photographs, as the artist can eliminate needless details and concentrate on what's important, and they can use various techniques to show internal parts in their working relationship to one another.

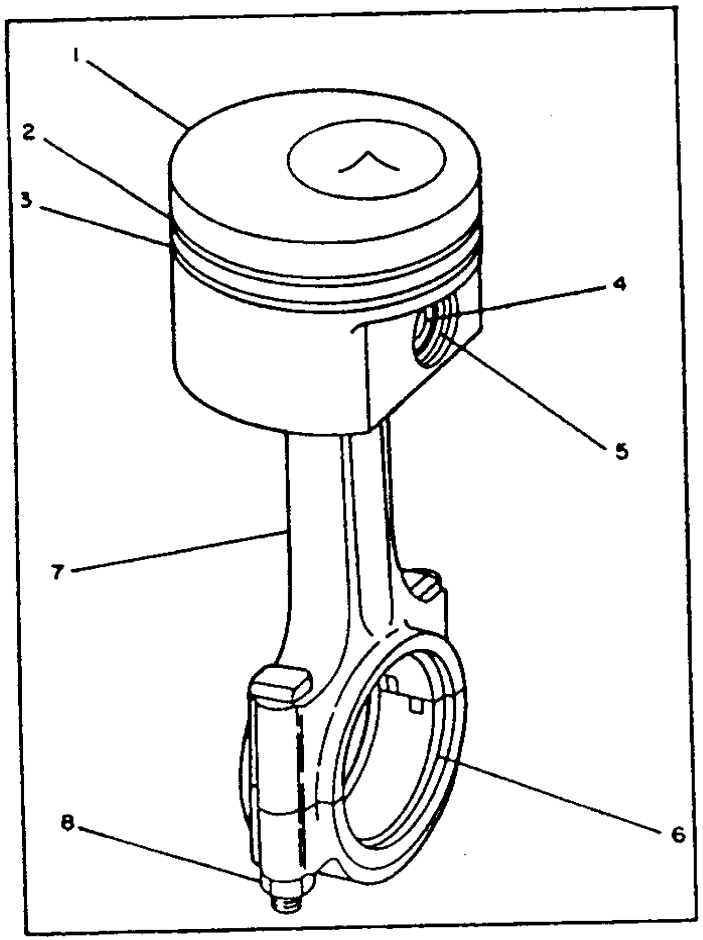

Marked-up Xerox Copy of a Photograph

Types of Line Drawings

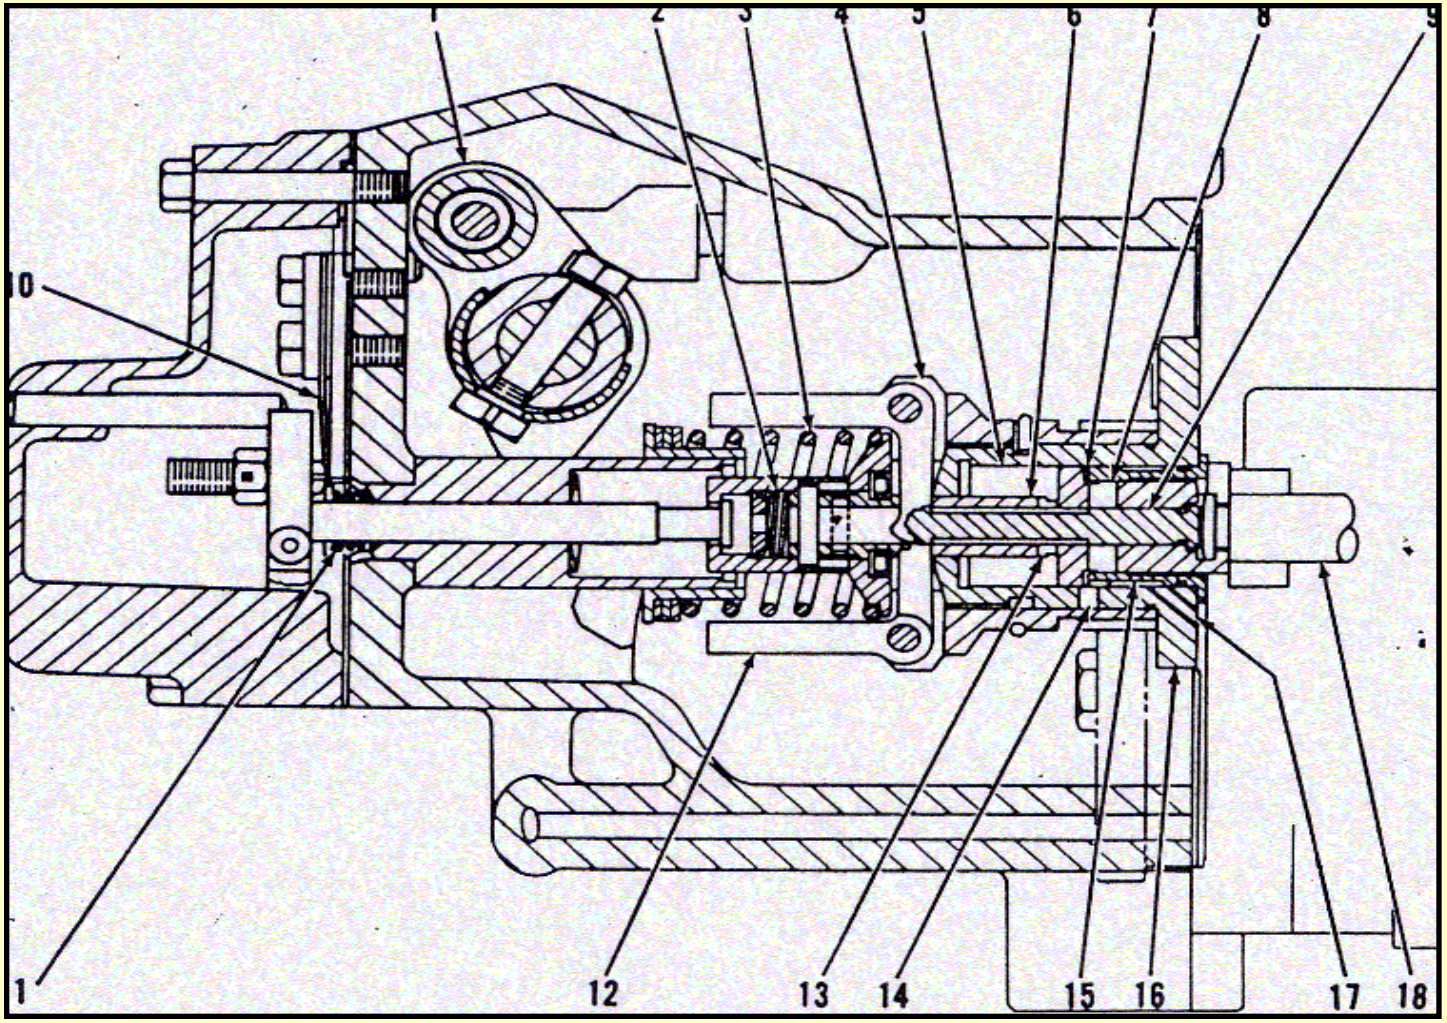

- **Two dimensional drawing:** Based on the common plane view of drafting or mechanical drawing.
- **Three dimensional drawing:** A little more realistic and allow most people to visualize an object easier.
- **Cross section:** A special variety of 2D drawing that shows an objective as if it had been sliced through the middle.
- **Exploded view:** Shows the component of a mechanism strung along a common axis.
- **Cutaway view:** A portion of the external housing of a mechanism are graphically "cut away" to show internal components.

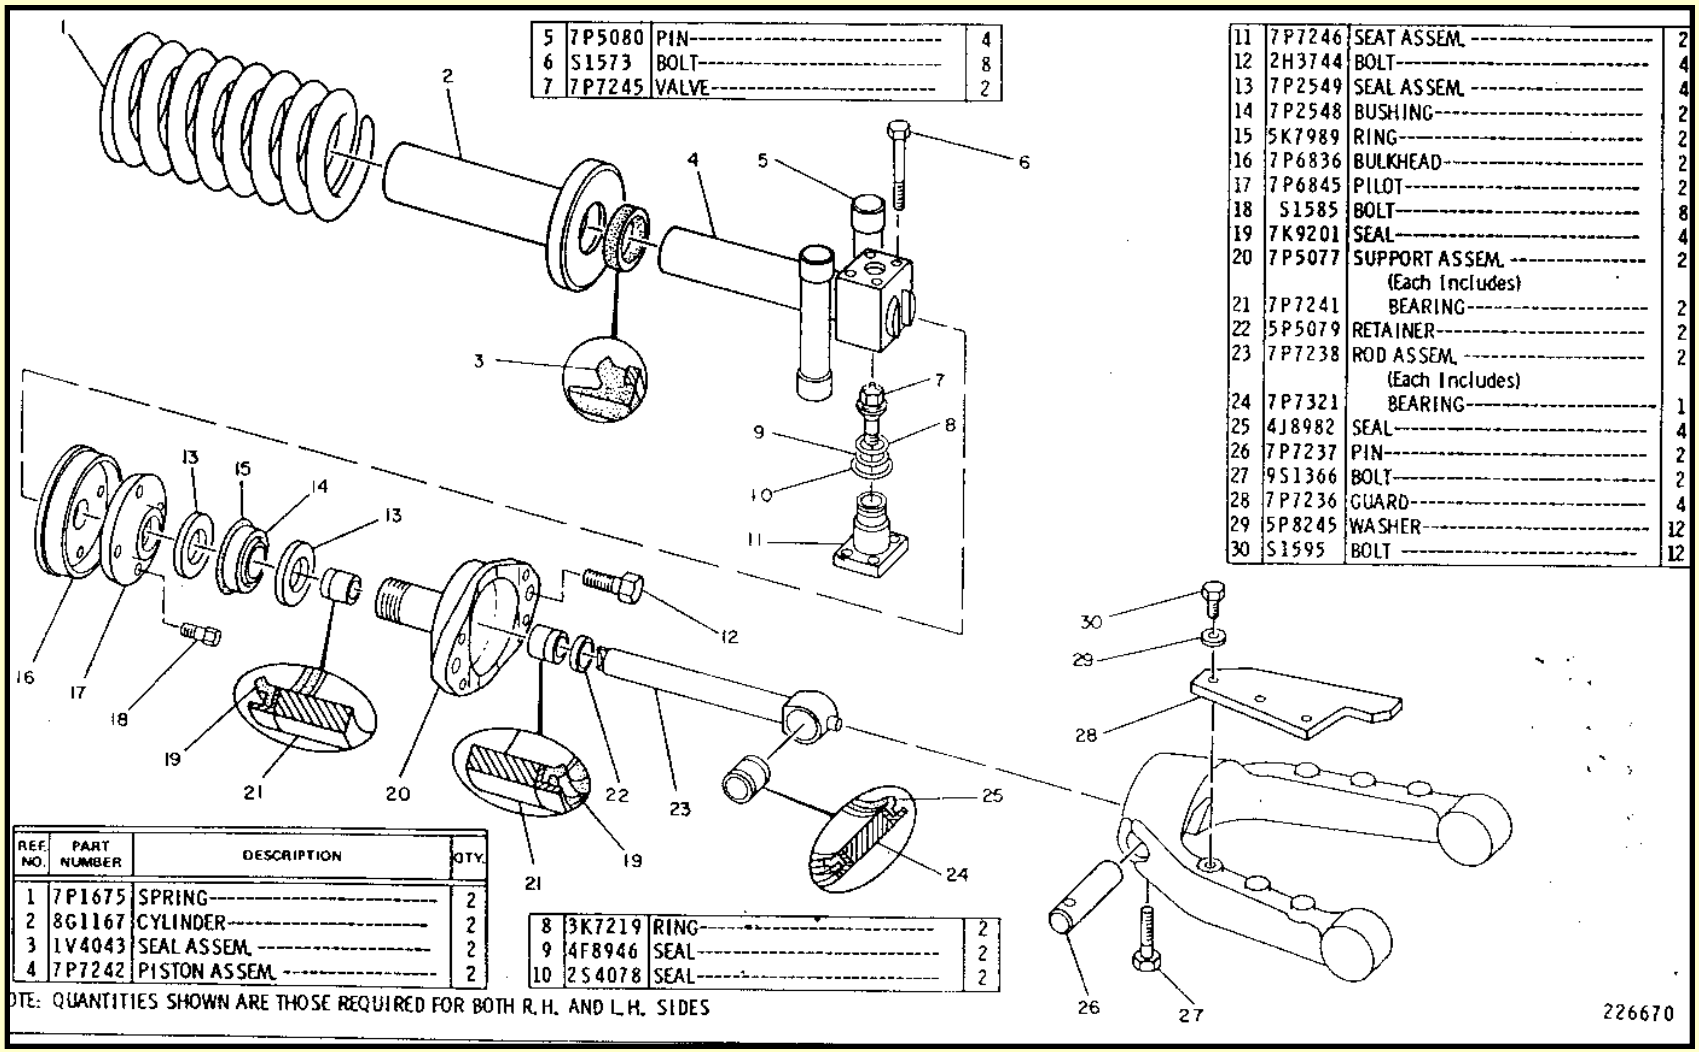

Two-Dimensional Line Drawing

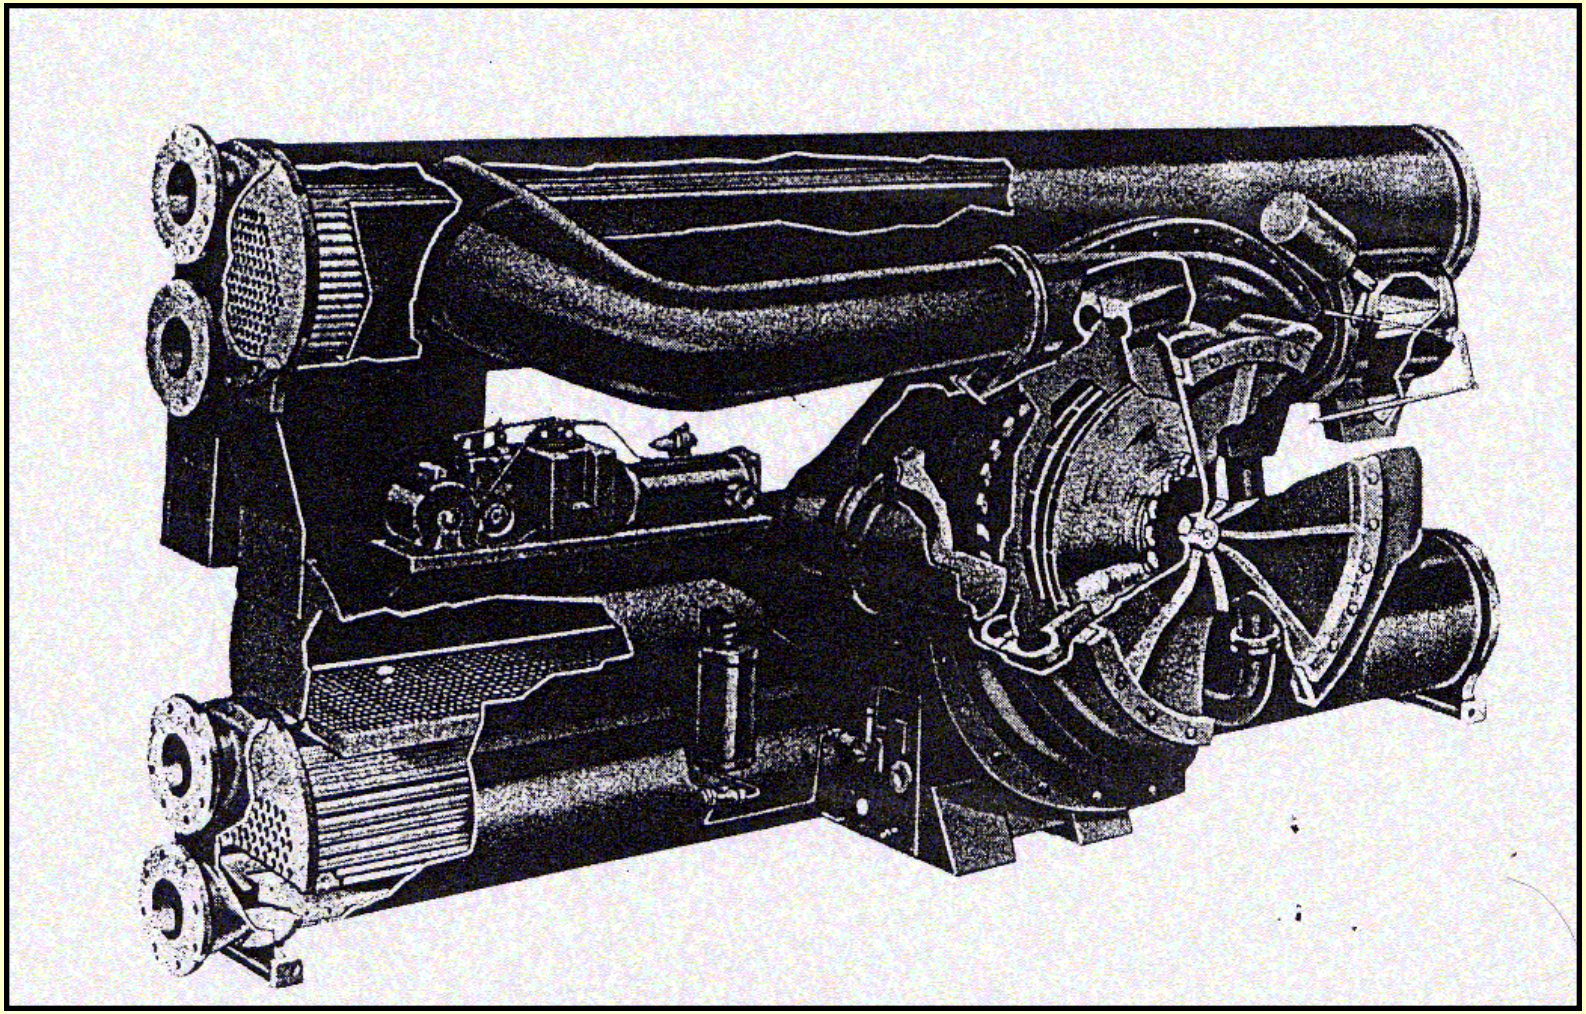

Three-Dimensional Line Drawing

Cross Section

Exploded View

Cutaway View

8. Documentation

- ***Documentation*:** refers to incorporating in-text references and bibliographic references or citations, into a piece of technical writing.
- ***In-text reference*:** The device used in the body of the text to refer the reader to bibliography.
- ***Bibliography*:** A list of books or references.
- Documentation consists of referring the reader to certain entries in the bibliography and providing in each of these entries sufficient data for reader to locate a copy of each reference.

Basic Reference Formats

- The variations in reference format tend to group the basic reference formats into three groups:

1) The **footnote** Format.

2) The **Author-date** Format.

3) The **Bracketed** Format.

- These differences chiefly in the form of the in-text reference, but there are differences in punctuation and order of elements in the bibliographic references as well.

The Footnote Format

- Is characterized by the use of superscript numeral:

Recent studies[12] confirm the use of this technique.

- The superscript number does not refer the reader directly to the bibliography but rather to a note at the foot of the page.
- Footnotes are not limited to bibliographic citation; they may contain author's comments, definitions of terms and explanations.
- The footnote for the first reference to a work cited contains complete bibliographic information

12. Frank A. Johnson, Computer Circuit Analysis: Theory and Applications (Englewood Cliffs: Prentice-Hall, Inc., 1976). p.265.

- Footnote for subsequent reference the same work contain the author's last name and a shortened version of the title:

12. Johnson, Circuit Analysis, p.325.

Since the footnote are scattered throughout the text, a separate bibliography is usually also employed. The entries are similar to the first-reference footnote but are arranged and punctuated somewhat differently:

Johnson, Frank A. *Computer Circuit Analysis: Theory and Applications*. Englewood Cliffs: Prentice-Hall, Inc., 1976.

Atkinson, Richard C. and Mary C. Harlow. "Activated Bio-Filter Secondary System. " *Journal of Sanitary Engineering Division, American Society of Civil Engineers*, Vol. 101, 1981, pp.44-56.

- Footnote may be gathered at the end of an article or chapter rather than placing them at the bottom of individual pages throughout the text. Such list of notes is called “endnotes” rather than “footnotes”

Endnote for a Technical Article

The Author-Date Format

- Is characterized by the use of the author's last name and the date of publication in parentheses:

Recent studies (Johnson, 1981) confirm the use of this technique.

- It refers the reader directly to the corresponding bibliographic reference in the bibliography.

F. A. Johnson. Computer Circuit Analysis. Englewood Cliffs: Prentice-Hall, 1976.

F. A. Johnson. (1976).Computer Circuit Analysis. Englewood Cliffs: Prentice-Hall.

tabulate T-units (Larsen-Freeman and Strom 1977, Vann 1978). In other words, whereas an index like the mean number of morphemes per utterance (MLU) seems to be useful only *below* a certain level (approximately five morphemes per utterance) of language development (Schumann 1976), T-unit analysis seems to be useful only *beyond* a certain level of development in the target language.

The second limitation has to do with the discriminating power of the T-unit. Length of error-free T-unit (and related measures) will distinguish learners with low proficiency from those with a high degree of proficiency, but it is not as sensitive an indicator of second language development as might be desired. In a number of studies (Monroe 1975, Cooper 1976; Larsen-Freeman and Strom 1977, Larsen-Freeman 1978), considerable overlapping between adjacent groups was noted. This is not the case with data in first language development. The difference may be due to the fact that while the ability to subordinate and embed sentences develops gradually over a number of years in first language acquisition, the process is by comparison far more compressed in adult second language acquisition (Cooper 1976).

selective ion implantation to localize active devices in the semi-insulating GaAs substrate, and gate densities over 100 000/cm^2 have been reported on very dense circuit structures [5].

The development of planar fabrication methods and high speed logic gate structures with modest power dissipation (<1 mW/gate) and high density has created interest in the extension of GaAs digital IC's into the large or very large scale of integration range. The achievement of LSI or VLSI is important if very high speed components for signal processors, computers, and memory are to be feasible in GaAs IC's. The high complexity of such systems makes it very desirable to include large numbers of components on a single chip to reduce the large quantity of high speed interconnections. Trends in this direction are also quite evident in silicon IC implemented signal processing and computational hardware [6], [7].

Very recent demonstration of high speed LSI parallel multiplier chips in GaAs MESFET logic [8] has proven that such chip complexities (over 1000 gates) are feasible in a well-controlled IC process. While further development and optimization

Reference List

09. Abstracts, Summaries and the Like

- People read abstracts and summaries for two reasons: (1) as an **aid** for deciding whether or not they want to read the entire document and (2) as a **substitute** for reading the entire document.
- If you know who is going to read the summary you write and what they are going to do with the information you present, you will have little difficulty coming up with an appropriate direction and level of details.

Abstracts

- The term **abstract** is most commonly used to refer to the summary that is written in conjunction with journal article or scientific or technical reports.
- The abstracts are read mostly by people doing library research on scholarly, scientific or technical topics.
- Abstracts may be divided into 3 common forms:

Descriptive Abstract.

Informative Abstract.

Evaluative Abstract.

Descriptive Abstract

- The **descriptive** abstract is the one you prepare to accompany an article or report you have written yourself.
- It is short (100-200 words) summary, listing or describing of the information contained in your article or report.
- It must be brief, clear and self-contained.
- The primary purpose of DA is to enable readers to decide whether or not they want to read the entire article or report.

Environmental assessment of spring water in Tafila district, southern Jordan: quality and chemistry

Omar A. Al-Khashman[a]*, Z.S.H. Abu-Hamatteh[b], S.M. Abu-Nameh Eyad[c], B. Abbassi[b] and K.S. Al-Whoosh[d]

[a]*Department of Environmental Engineering, College of Engineering, Al-Hussein Bin Talal University, Ma'an, Jordan;* [b]*Department of Water Resources and Environmental Management, Faculty of Agricultural Technology, Al-Balqa' Applied University, Al-Salt, Jordan;* [c]*Department of Applied Sciences, Prince Abdullah Bin Ghazi Faculty of Science and Information Technology, Al-Balqa' Applied University, Al-Salt, Jordan;* [d]*Department of Natural Resources and Chemical Engineering, Tafila Technical University, Tafila, Jordan*

(*Received 23 September 2008; final version received 28 June 2009*)

This study evaluates the chemical and physical characteristics of Tafila district spring water and monitors the changes in the quality of the water from January 2006 to January 2008 to determine the influence of possible pollution sources (natural and anthropogenic) on various chemical parameters. It also aims to characterize the suitability of the water for drinking and agriculture. The results show the physical and chemical characteristics to lie outside the permissible levels of the Jordanian and WHO drinking water standards. However, the trace metal concentration in the water samples is satisfactory for health and the environment.

Keywords: Environmental assessment; springs; trace metals; inorganic contamination; Jordan

Specimen Descriptive Abstract

Informative Abstract

- **IA** is typically longer than a DA, ranging for 2 to 10 percent of the length of the article or report it summarizes.
- Usually, you will prepare IA of articles or reports written by other people.
- The readers of your IA seek scientific or technical information limited that pertains to a specific and limited topics that they are interested in.
- Your goal is not just to summarize the article or report but also to summarize it with respect to your readers topic of interest.

THE CRYSTALLIZATION OF GLASSES IN THE Mg-Si-O-N SYSTEM Order No. 8200269

SHAW, THOMAS MCCARROLL, PH.D. *University of California, Berkeley*, 1981. 134pp.

The general crystallization behavior of glasses in the Mg-Si-O-N system has been investigated.

In preparation of the glasses, it was found that Si_3N_4 was a necessary constitutent of melts for glass formation, but that decomposition reactions limited the range of compositions which produced useful glasses. Melts of SiO_2 rich compositions separated into SiO_2 rich and MgO rich glassy phases on cooling. Compositional analysis of the phases established that phase separation results from extension of the miscibility gap in the MgO-SiO_2 system into the Mg-Si-O-N system.

Crystallization in a glass of composition 59 wt% SiO_2, 32 wt% MgO and 9 wt% Si_3N_4 was investigated in detail using the techniques of differential thermal analysis, x-ray diffraction, optical microscopy and transmission electron microscopy. Crystallization occurred mainly by internal nucleation of crystals, although some surface crystallization was also observed. Intermediate temperature heat treatments in the temperature range 1000°C-1300°C crystallized the MgO rich phase of the glass to spherulites of enstatite, but had no effect on the SiO_2 rich phase. The spherulites developed at intermediate temperatures consisted of fan like arrangements of plate shaped enstatite grains separated by thin films of uncrystallized glass. After heating to temperatures above 1300°C, faceted grains of enstatite were formed adjacent to the SiO_2 rich pockets by recrystallization of the spherulites. Heating to above 1300°C also precipitated crystals of Si_2N_2O residual glass between enstatite grains in the spherulites. Volume changes on crystallization of the glass caused porosity to form throughout the microstructure.

The effect of two stage nucleation and growth heat treatments on microstructure were investigated. Nucleation treatments at temperatures of 800°C-1000°C brought about a considerable refinement of the microstructure and optimum nucleation occurred at about 850°C. The effect of nucleation treatments were limited, treatments longer than 2 hours producing no further refinement of the microstructure. A brief study of crystallization in glasses of other compositions showed that nucleation was also highly sensitive to the composition of the glass. Circumstantial evidence suggests that nucleation was caused by silicon impurity particles precipitated from the glasses on cooling from the melt.

The results indicate that Mg-Si-O-N glasses may be useful as starting materials for the production of glass ceramics of new compositions. Additional experiments for exploration of this possibility are suggested.

Specimen Informative Abstract

Evaluative Abstract

- **EA** is basically an informative abstract plus your own evaluation of the quality of work done, the significance of the work done, and the pertinence of the information to the overall topic of interest.
- They are generally prepared by junior member of a research team and are read by other members of the team so that they can decide whether or not they want to read the complete work.
- EA is an internal working papers rather than documents prepared for publication.

The consistent outlines of EA are:

- Summary of the purpose of the research reported in the original article.
- Summary of the methods and procedures used.
- Summary of the research findings or results.
- Summary of the author's conclusions and discussions.
- The abstractor’s evaluation of the work being reported.

Abstract

Kummer, Hans
1968 Reproduction. in Social organizations of hamadryas baboons. Chicago: The University of Chicago Press, pp. 175-179.

Kummer's book describes his study of free-living hamadryas baboons in Ethiopia. While the chapter on reproduction includes a short section describing maternal behavior at birth, the vast majority of it discusses the synchronization of reproductive cycles.

Kummer collected data on seven troops between January and October of 1961. Among these hamadryas, whose cycles average 30 days in length, three reproductive stages were identified: females with young infants; females with perineal swellings; and anoestrous females, including those who were pregnant or who had nursing juveniles. In June, when it was noticed that females of a one-male unit were often in the same phase of oestrus, detailed recordings of the reproductive states of females in one-male detached units began.

This study focused on 41 one-male units, with two adult females each. Most often, it was found that the two adult females plus the two and three year old juveniles were in the same reproductive phase. The observed frequencies of reproductive phase combinations were compared with the frequencies expected if these phases resulted from random combination. The differences were marked, indicating clearly that reproductive phases were not randomly distributed. After the May - June mating peak, the oestral synchronism of the units declined somewhat; an increasing number of females lacked signs of sexual swelling when they were expected to be in oestrus. The possibility exists that many or all of these females were, in fact, pregnant. However, with the births from this mating period not expected unit November or December, Kummer did not have a chance to record them.

Kummer concluded that social factors do affect female oestrus cycles within single male units. It was also apparent that sychronization of reproductive cycles was an intragroup rather than an intergroup phenomenon.

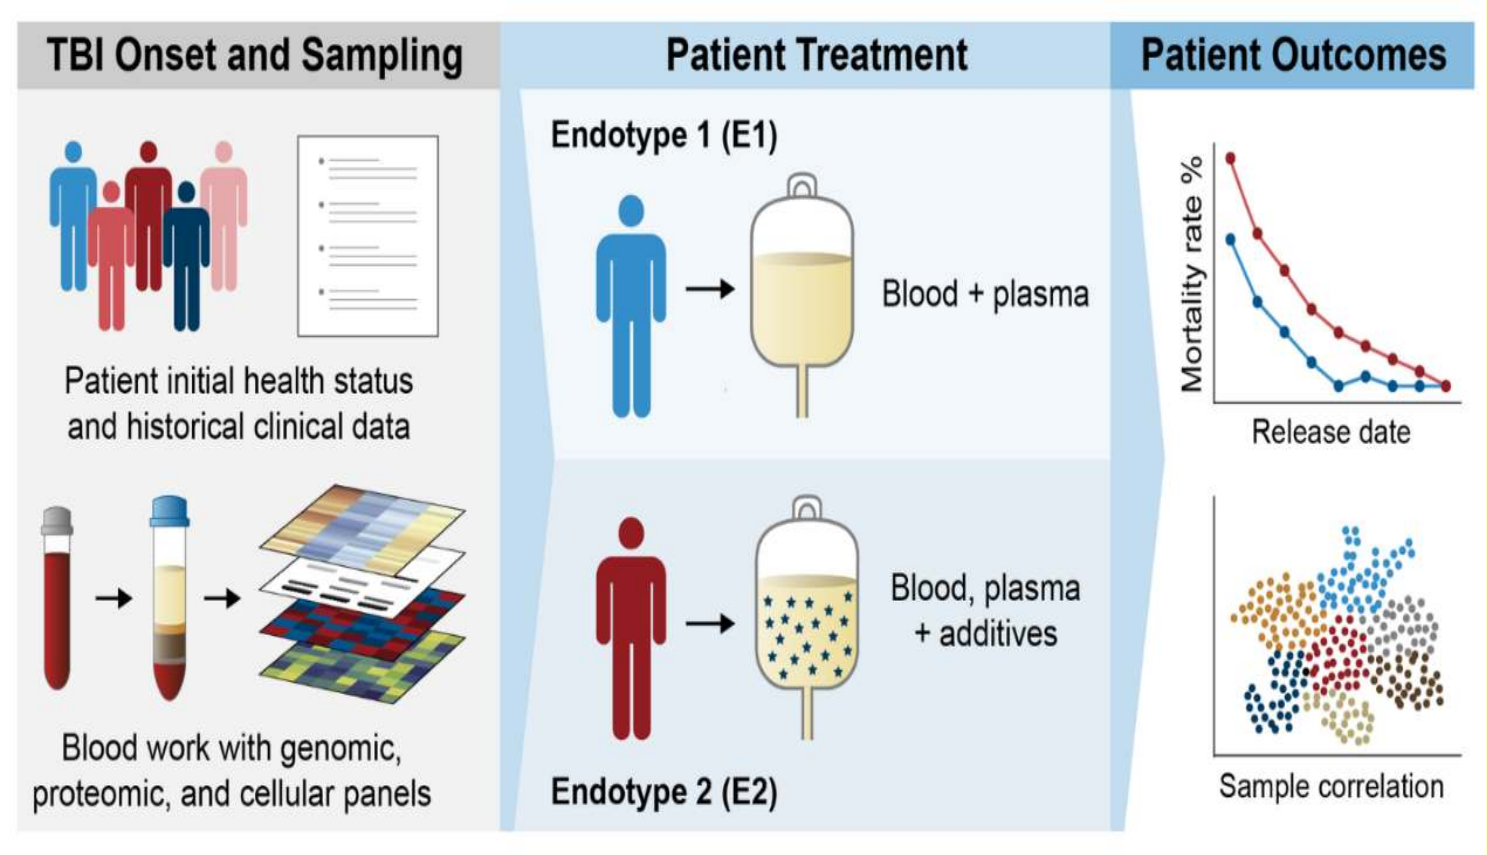

This chapter of Kummer's has not been cited in the other few articles discussing synchronization, probably because book chapters are not listed in Index Medicus or Biological Abstracts. It is, however, a valuable addition to the meager literautre on this subject. Kummer's work, since it focused on other primates, is certainly much more relevant to human research than are the rodent studies. The fact that Kummer's observations were conducted in the wild adds to their significance.

Specimen Evaluative Abstract

Graphical Abstract

This is a single, concise, symbolic and visual summary of the main findings of the article/research project. The goal of the GA is to create a clear story of your scientific methods and results that is quickly understood by your audience. It could either be the concluding figure from the article or better still a figure that is specially designed for the purpose, which captures the content of the article for readers at a single glance.

Examples of a well-designed GA

Video Abstract

A **video abstract** is the motion picture equivalent of a written abstract. Usually not longer than 5 minutes, video abstracts help the viewer to get a quick overview on a scholarly paper, research article, thesis or review: and to quickly ascertain the purpose and results of a given research.

Example: **https://youtu.be/kSp3pKfe_fo**

Summaries

- A **summary** differs little from an informative abstract. The chief distinction lies in the fact that the term abstract is used with research-related activities, while the term summary is used more with documents that are administrative in nature.
- Traditionally, a summary appeared at the end of a document and recapitulated its main points.
- It serves mainly to remind the readers of what had been said.

Types of Summaries

1) Executive Summary:

- An Executive summary or introductory summary is a component of a formal or semi-formal report.
- It is designed to give the gist of a report, in clear and effective way.
- It should be the last part of the report.
- Limit yourself to a single type written page for reports of a dozen pages and limit yourself to 5% or so of total reports length for longer reports.

2) Concluding Summary:

- A concluding summary is used to present the conclusion of the main points of the body of your report (recapitulating the main points).
- Don’t introduce new information or new argument, just summarize.

Definitions

- ***State-of-the-Art Papers*: it is a paper designed to bring someone up to date on a particular topic so that he may discuss it intelligently.**
- ***Literature Search*: is an exhaustive survey of the published literature on a given topic.**
- ***Literature Review*: literature review is a document that comes out of such activity.**
- ***Annotated Bibliographies*: is a bibliography that contain some commentary on each reference (descriptive abstract or evaluative abstract or comment).**

analyzing technical writing, however, we find that many of the "faults" are justifiable if not carried to extremes, and if not used inappropriately when writing for nontechnical audiences.

Scholnick, E. K. and Adams, M. J., Relationships Between Language and Cognitive Skills: Passive-Voice Comprehension, Backward Repetition, and Matrix Permutation, *Child Development, 44:*4, pp. 741-746, 1973.

*Semantic and cognitive factors governing passive-voice comprehensions were explored. Ninety-six children, divided among three grade levels (kindergarten through second), identified the object referred to by nonsense-syllable actors and recipients in passive sentences and reversed active sentences and a classification matrix. Comprehension of passives did not require reversal to an active form since children who understood passive sentences did not necessarily pass the language and matrix reversal tasks. Level of comprehension of passives, but not backward repetition, was affected by actor content. But, there were significant intercorrelations among the tasks, and, therefore, some overlaps in linguistic and cognitive performance.

Siegel, D., Nonsources of Unpassive, in J. P. Kimball, *Syntax and Semantics, 2*, Seminar Press, New York, pp. 301-317, 1973.

Siegel identifies an unpassive as a sentence "characterized by the presence of an auxiliary verb (either "be" or "go"), by the presence of a past participle prefixed by "un-," and by the optional presence of an agent phrase." Nonpassive sentences rarely derive from well formed active sentences ("The president's blunder was unreported" has no acceptable active equivalent: "The press unreported the President's blunder"). She concludes with three features any explanation of unpassives must include.

Stanley, J. P., Passive Motivation, *Foundations of Language, 13:*1, pp. 25-39, May 1975.

Stanley summarizes the current inadequate explanations of the meaning and function of the passive, believing that the focus on word-order only limits explanations and understanding. Rather, she will analyze how writers use the passive, its contexts, the situations where the writer needs it, and those uses judged acceptable. She will further attempt to answer questions about why it exists at all. She reviews representative discussions of the passive, offers contemporary uses of it, and presents explanations of these uses. A theoretical analysis follows this material. She suggests two reasons why the speaker/writer would choose passive: (1.) don't know logical subject; and (2.) do know it but don't want to provide it. She concludes by asserting that the use of the passive voice reflects a philosophical orientation, allowing the writer to appeal to some universal source for validation that the reader may or may not know.

Stanley, J. P. and Robbins, S. W., Forced Inferences: Uses and Abuses of the Passive, *Papers in Linguistics, 10*, Edmonton, Canada, pp. 299-311, 1977.

The authors are concerned about why the passive "has become one of the most widely used sentence patterns in the language." They believe that the passive is a device the writer can select to persuade the reader/hearer a

Specimen Annotated Bibliography

Meeting Minutes

- ***Meeting minutes*** **serve three basic purposes:**

1) To remind people who attended the meeting what went on.
2) To allow people who didn't attend the meeting to get some idea of what went on.
3) To document for archival purposes the key actions that took place at the meeting.

- A good set of minutes must include the following items of information:

1. **Data on the meeting itself:** Time, place, attendance, who presided over the meeting, nature of the meeting (regular or special) and the purposes of the meeting.
2. **A record of formal motions made:** the precise wording of motions made.
3. **A record of other formal actions taken:** Reports heard and accepted, resolutions passed, items referred to committees, questions raised.
4. **A summary of discussion:** Discussion on motions, resolutions and amendments, questions on and discussion of reports, comments.

UNIVERSITY CURRICULUM COMMITTEE MINUTES

(1976-77 Meeting #4, 4 October 1976)

The meeting was called to order by the chairman at 4:10 p.m. in the Education Conference Room. Members attending: Knight (chmn.), Byers, Carson (w/o vote), Falter, Gunning, Iriarte, Lawrence, Siems, Stauber, Tovey for Jacobsen, Members absent: Jacobsen, Jenkins, Telin, Wohler. Observer: Professor D. O. Everson. The minutes of the preceding meeting were amended to show that Professor Byers, not Professor Lawrence, seconded the motion to table (p. 2) and were approved as amended.

Proposed Program in Computer Science Ready (UCC-76-047). Professor Siems reported that the Information Science Subcommittee has reviewed the revised course outline for the proposed computer science course, CS 101, Introduction to Computer Algorithms; the subcommittee recommends that UCC approve the entire program for forwarding to Faculty Council.

MOTION: That item #1 of UCC-76-047, the addition of CS 101, be approved, and that the entire proposal be forwarded. Motion passed unanimously.

Proposal Program in Applied Statistics Approved (UCC-77-006). The report from the College of Agriculture entitled "Proposed Program in Applied Statistics," 15 September 1976, was taken up for action.

MOTION (moved and seconded by the Information Science Subcommittee): That the Program in Applied Science be approved as presented in UCC-77-006; (See below.)

Members of the committee, particularly those who have sat on the Information Science Subcommittee during the years that the proposal was being formulated, were enthusiastically in favor of the proposal. The discussion focused on details of implementation of the program, especially the proposal to jointly number the proposed course ApSt 301, Principles of Statistics, in four or five departments. Questions were raised concerning (1) keeping the basic statistics course in the course listing for the College of Business and Economics so as to facilitate accreditation of the college; (2) providing for multiple sections to be listed in the time schedule of one of the "sections"--renumbering the sections 301A, 301B, etc., was considered, but that would defeat the idea of jointly numbering them; (3) teaching the course at the sophomore level in the business college and at the junior level elsewhere--everyone seemed to agree that reducing the level of the course to 200 is a good idea because, among other reasons, if a graduate student takes the course, he shouldn't be able to get credit for it; (4) correclating the descriptions of the various sections of a jointly-numbered course so that they are in fact the "same as"; (5) coordinating the assignment of instructors for applied statistics courses.

MOTION TO AMEND (Siems, Byers): That the section of the proposal entitled "Proposed courses" (on pp. 7-8) and section 4-d (on pp. 8-9) be deleted, and that the remainder of section 4 be relettered. Motion to amend passed unanimously. When the vote was taken on the main motion as amended, it too passed unanimously.

The meeting was adjourned at 5:10 p.m.--Franklin D. Carson, Secretary

Specimen Meeting Minutes

10. Recommendation Reports

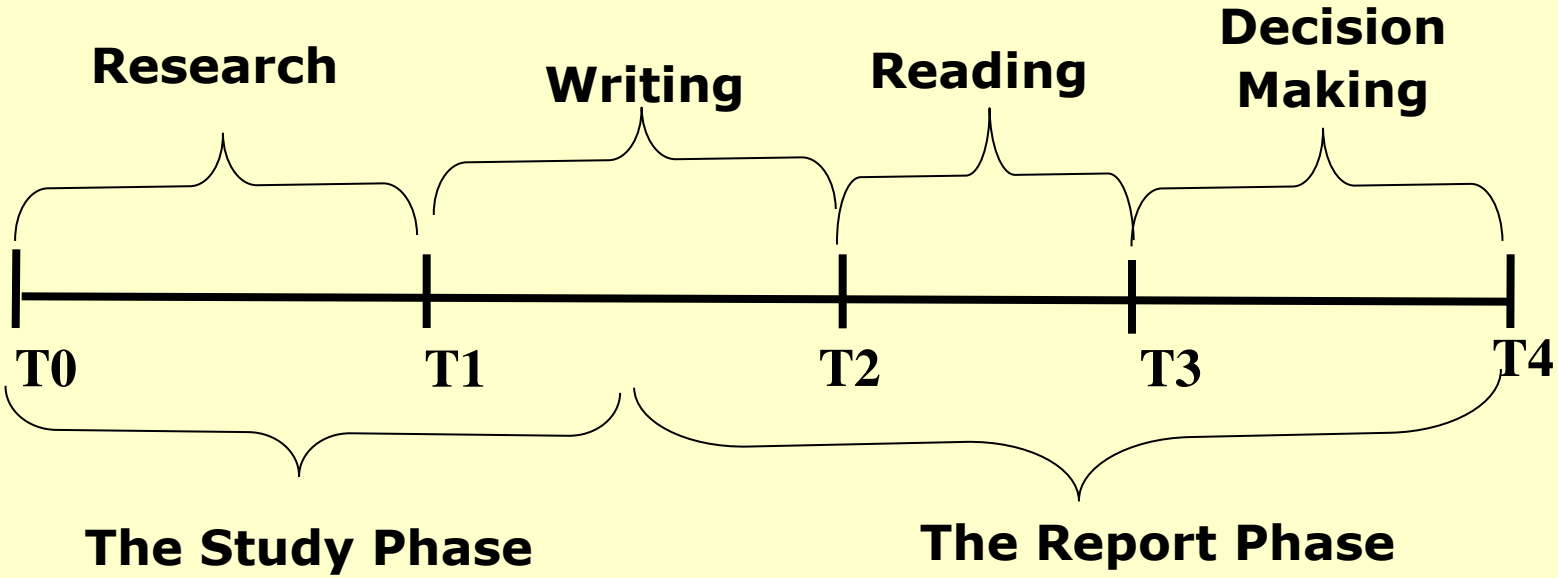

- **Recommendation** reports (feasibility reports or analytical reports) is the key tool organizational managers use to help them select among alternatives.
- Feasibility study is a staff activity in which an employee or a small group of employees gather some data on two or more alternatives, analyze the data and draws some conclusion.
- The recommendation report is the final product of such study (a document that conveys a recommendation, together with supporting data and interpretation and decision).

The Study Versus the Report

- It is important to keep the data-gathering and analysis phase separated from the reporting phase and equally important to keep these two separated from the decision-making phase.
- The decision is the management function that is based on the information in your report. The report itself does not decide.
- You cannot begin writing your report until after you have gathered and analyzed your data and drawn a conclusion.

•The study phase must be completed before the reporting phase begins.

• Similarly, the reporting must be completed and submitted before the management decision can be made.

The Phases of Studying and Reporting

General Outline for Recommendation Reports

- **General outline for most recommendation reports:**

1) Introduction: (purpose, definition of the problem, scope; alternatives, criteria, limitations)

2) Description of Alternatives:

3) **Presentation and Interpretation of Data for 1st Criterion:** (Explanation of criterion, presentation, and interoperation of data, presentation of 2nd, 3rd, 4th alternatives, etc.)

4) Presentation and Interpretation of Data for 2nd , 3rd, 4th Criteria, etc.

5) Conclusion:

6) Recommendation:

11. Project Reports

- A **project** is term used in business, industry and government, is an extensive undertaking that requires the concerted effort of several people.
- Categories of project reports:

1. Reports of individuals' activities.
2. Reports of data for archival purposes.
3. Progress and status reports.

Activities Reports

- The most common of activities reports is the periodic activities report (weekly or monthly), in which you explain how you've spent your time during the preceding reporting period.
- Keep a record of both "milestones" (dates on which you started and finished individual tasks and the hours each day you devote to individual tasks.

Archival Data Reports

- Majority of such reports are fill-in-the-blank reports that contain primarily numerical data.
- They contain data so that they are available at some later date for plotting trends or establishing benchmarks or serving some other historical or archival purpose.
- They should be accurate and neat.

Progress and Status Reports

- **Progress and status** reports tend to be longer and involved than activities reports and archival data reports.
- **Progress and status** reports are similar in that they both discuss the state of affairs with respect to the collective activities of a group of people.
- **Progress reports** tend to be project-oriented, while status reports tend to be oriented towards a task force or work group(or departments or divisions).

- **Progress reports** tend to cover a period of time (a month or a quarter), while status reports tend to deal with a slice of time (the end of a month or the end of a quarter).

- Other names of reports that fall in this categories includes periodic reports (monthly reports, quarter reports, annual reports), interim reports and just plain project reports.

Progress Reports

- **The general outlines for a progress report:**

1. Introduction:(Purpose of the reports, Time period covered, Reference of other reports).

2. Summary of Project Status: (Different phases or tasks of the project).

3. Work Completed During Reports Period: (Different phases or tasks).

4. Work Anticipated for Next Period:

(Different Phase and tasks).

5. Special Problems of Difficulties:

Status Reports

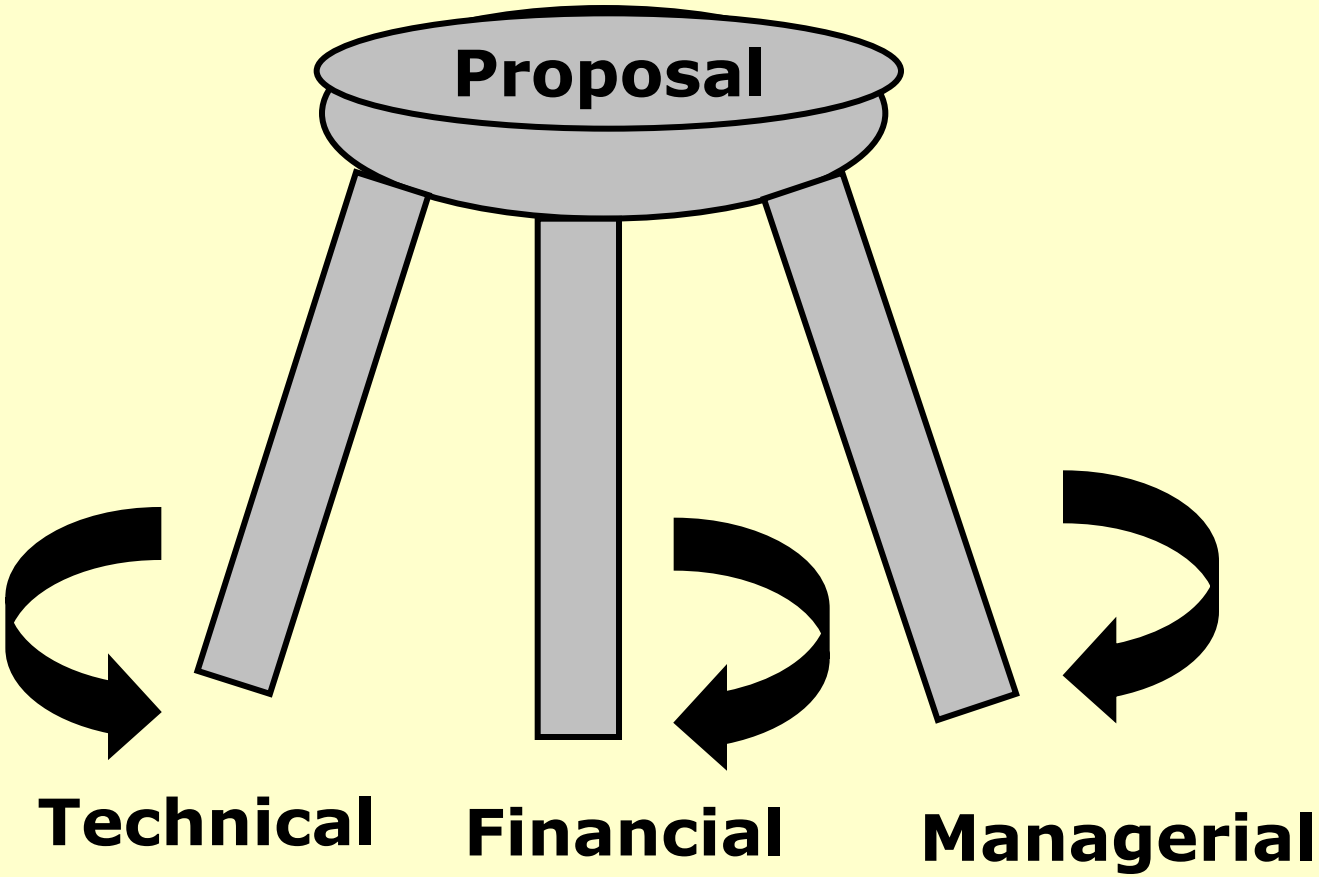

- **The general outlines for a status report:**

1. **Introduction:** (Purpose of the reports, Date of the report, Reference of other reports).
2. **Summary of Project (or Department) Status:**
3. **First Project Phase (or Department Section):** Major accomplishments since last reports, Tasks anticipated during coming period, Special problem of difficulties.
4. **Second (and subsequent) Project Phase (or Department Sections):** Major accomplishments since last reports, Tasks anticipated during the coming period, Special problem of difficulties.

12. Proposals

- A proposal is a **documented idea**.
- A written proposal is a document that proposes a solution to a technical problem and provides sufficient information so that management decision-makers can decide whether or not the proposed solution will be accepted.
- In order to accept a proposal, management must be convinced:

- That the proposed solution is technically sound and operationally feasible (**Technical Section**).
- That the person or group proposing to solve the problem is indeed capable of effecting a solution (**Managerial Section**).
- That all costs have been identified, the costs are reasonable, and the benefits of the solution are commensurate with the total cost (**Financial Section**).
- A proposal like a three-legged stool. If any one is missing or weak, the proposal collapses, like a stool with one leg jerked out from under it.

The Proposal as a Three-Legged Stool

- A proposal is similar to recommendation report in that it deals with a solution to a technical problem.

- But it differs from the recommendation report in that it focuses on a single solution rather than alternative solutions and it goes beyond a discussion of *what* should be done to include information on *how* it will be done, *how* long it will take, and *how* much it will cost.

The Three Varieties of Proposals

1) The In-Firm Proposal:

2) The Firm-to-Firm Proposal:

3) The Research Grant Proposal:

The In-Firm Proposal

- The in-firm proposal is a document you use to convey ideas about your solution to a problem within your organization.
- In-firm proposals are usually informal or semiformal.
- The emphasis in most of in-firm proposals is on the technical solution and the cost-benefit analysis.

The Firm-to-Firm Proposal

- The one-sentence of a firm-to-firm proposal is "**X** proposes to do **Y** for **Z** for **W** dollars". "International Engineering proposes to design a new wastewater treatment facility for the City of Amman for $2,400,000".
- In other words, the firm-to-firm proposals is a statement of **who** is going to do **what** for **whom** and for **how** much.

The research Grant Request

- A request for research funding is not an act of begging. It is an offer of services rendered for a stated price, and as such it is really a proposal.
- Funding agencies and organizations are eager to award research funds; their very existence depends on their ability to disperse the fund they have control over.
- What they need is something to hang their hat on. They don’t require a guarantee of success.
- The research grant request often includes a literature review or a state-of-art statement.

General Outline of Proposals

- **Introduction:** (Purposes of the document, Problem to be solved and scope of the proposal).
- **Technical Section:** (Back ground, Methodology and time and work schedule).
- **Managerial Section:** (Credentials and experience of the firm, Facilities and personnel available and Authorities and Accountability).
- **Financial Section:** (Costs, Methods of payment and Revenues or cost savings generated by the project).
- **Tangible Products of the Project:**
- **Urge to Action:**

13. Technical Articles

- Articles differ from the other forms of technical writing chiefly in three ways:

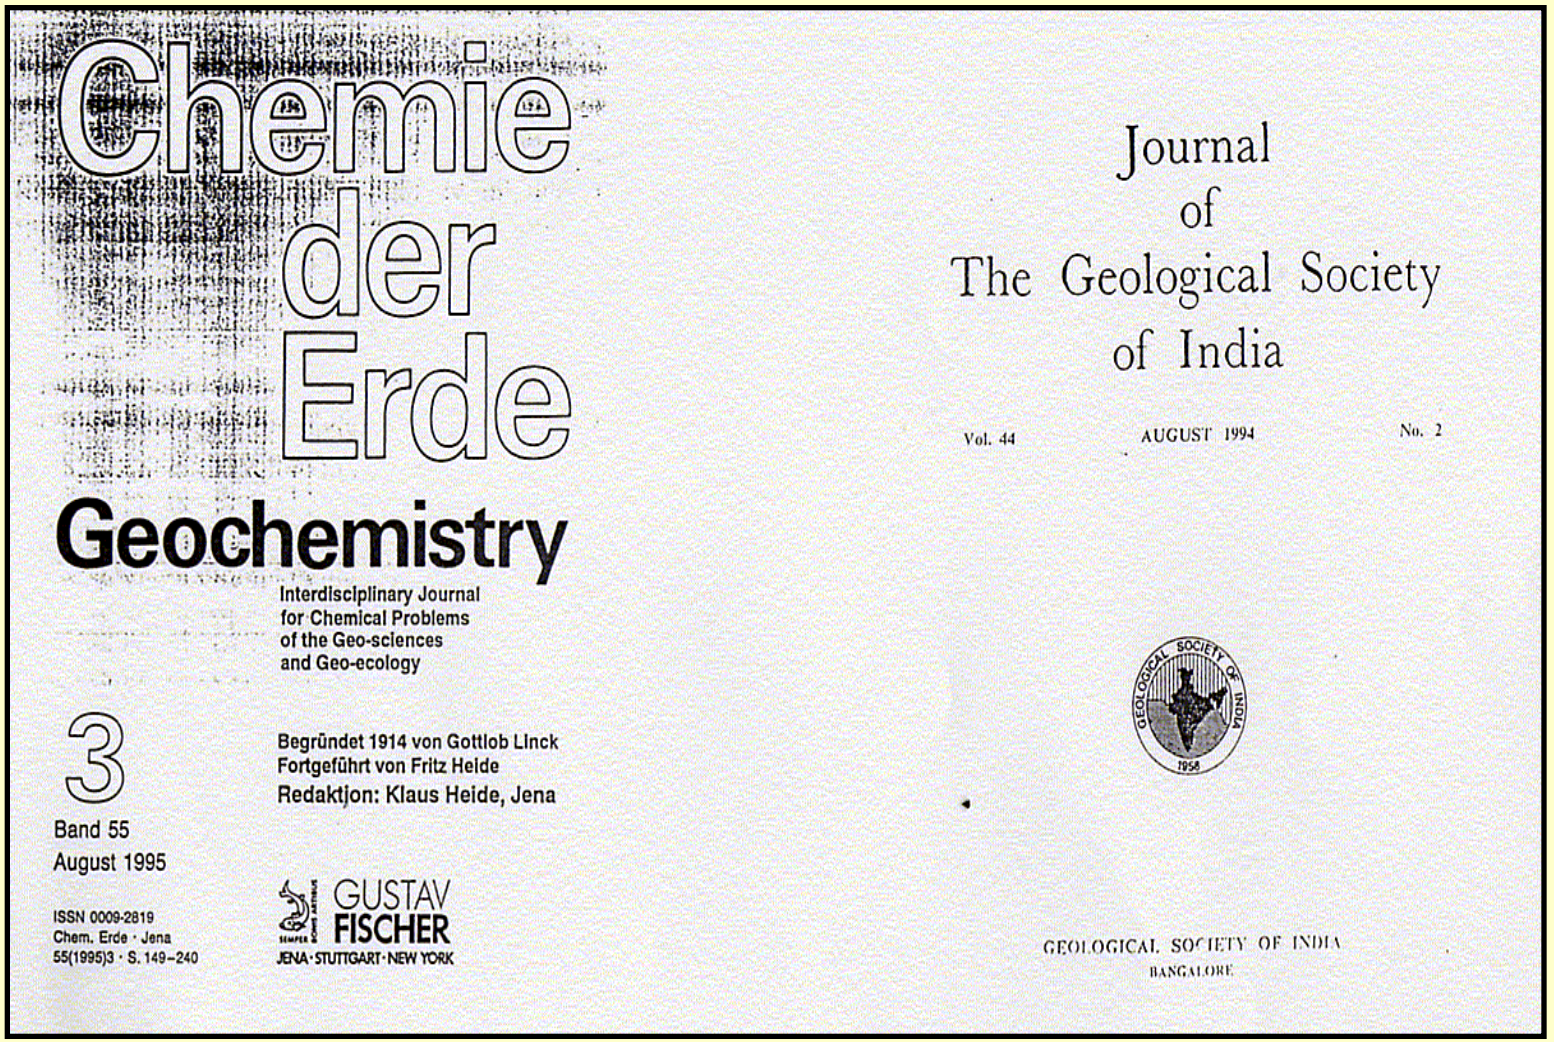

1. They are written to inform rather than to initiate some specific action.
2. They are published and distributed by some organizations other than the one the writer works for.
3. They are directed towards an unknown and wide-ranging audience rather than a specific and captive audience.

Reasons to Write a Technical Article

- In order to publish the results of your original research.
- Enhance your career by publishing articles on techniques you have developed, new products, new concepts and applications in applied fields of science or technology.

Periodicals

- They contain articles of technical or scientific nature.
- They are found in a spectrum ranging from the most prestigious scholarly journals and publications of professional societies through trade journals and technical magazines and on into commercial and popular magazines.

Geochemistry of early Proterozoic mafic and ultramafic rocks of Jharol Group, Rajasthan, Northwestern India

Z.S.H. ABU-HAMATTEH[1], M.RAZA[1] AND T. AHMAD[2]
[1]Deptt. of Geology, Aligarh Muslim University, Aligarh-202002
[2]Wadia Insitute of Himalayan Geology, 33, Gen. Mahadeo Singh Road, Dehra Dun-248001

Abstract: The deep water Jharol sediments of Aravalli Supergroup host sporadic bodies of mafic-ultramafic rocks. Field evidence suggests that at least some of these rocks are extrusive in nature. Low to medium grade metamorphism and intense deformation has obliterated the original mineralogy and texture of these rocks. The ultramafic rocks are relatively more altered (serpentinized) with highly disturbed geochemical composition which cannot be used for petrogenetic interpretations. On the other hand, the mafic rocks are relatively less altered with some relict plagioclase feldpars. Geochemically, these mafic volcanics are Mg- and Fe- rich tholeiites.

These tholeiites have nearly flat to slightly enriched REE patterns (about 30 to 40x % chondrite La and 20 to 25x % Chondrite Yb), with $(La/Yb)_N$ ratio ranging between 1.29 and 1.54 and $(Gd/Yb)_N$ ratio ranging between 0.97 and 1.07. All samples show slight to strong positive Eu anomaly.

Immobile incompatible-element geochemical patterns and other binary plots suggest that these tholeiites have enriched chemistry and that probably they have been derived from enriched source(s) and resemble closely with within plate and initial rift tholeiites.

Trace elements, including REE based petrogenetic modelling indicate that (a) the source had about 3x% chondoritic REE abundances with nearly flat to slightly depleted pattern and (b) that these rocks were generated by about 8 to 12% partial melting of the modelled source followed by some olivine and clinopyroxene fractionation. Field as well as trace element characteristics indicate rift related (lithospheric extension) generation of these basalts with some influence of asthenosphere (deep mantle) on the lithospheric source(s) as indicated by positive Nb and Sr anomalies.

Keywords: Geochemistry, Jharol mafics, Aravalli Supergroup, Proterozoic volcanism, Rajasthan.

INTRODUCTION

The Proterozoic sequences of the Indian shield are well developed in its northwestern part where they constitute one of the oldest orogenic belts represented by the Aravalli-Delhi mountain belt. The evolutionary history of this great belt has been in debate for a long time. Several models involving Wilson cycle (e.g. Sinha-Roy, 1988) to resurgent rifting (Roy, 1988, 1990) have been proposed. However, all the models overlooked the significance of mafic volcanics which show a very good distribution in time and space. Amongst the early Proterozoic belts of this region, the Jharol belt constitutes an extensive series of deep water metasediments of Aravalli Supergroup along with sporadic occurrences of mafic and ultramafic rocks. This belt has a unique position in the geological setting of Aravalli-Delhi mountain belt because amongst all the early Proterozoic basins of this region, only the Jharol belt hosts a thick package of deep water sediments. In some models (Sychanthavong and Desai, 1977; Sen, 1981; Sinha-Roy, 1988) the mafic-ultramafic rocks of Jharol belt have been considered as part of the obducted oceanic crust, although the geochemical study of these rocks has never been attempted earlier. Here we describe the results of our preliminary geochemical investigation on these mafic and ultramafic rocks and discuss their source characteristics and tectonics of eruption.

General Rules

1. Choose your title and write your abstract with considerable care.
2. Identify the key words for your study and use them in your title.
3. Make your abstract more informative than descriptive but keep it brief.
4. In your introduction, tell your reader what you have done and why.
5. Discuss earlier published works that are directly pertinent to your work.

6. Specify the problem you have studied, identify your research hypotheses, explain your research strategy or design and discuss the theoretical aspects of the work.
7. If the report is lengthy, give your reader brief overview of the main body.
8. Material and methods section should be complete and brief.
9. Include subsection on materials, equipment and apparatus, experimental and control groups, sampling techniques and statistical methods and research procedure.

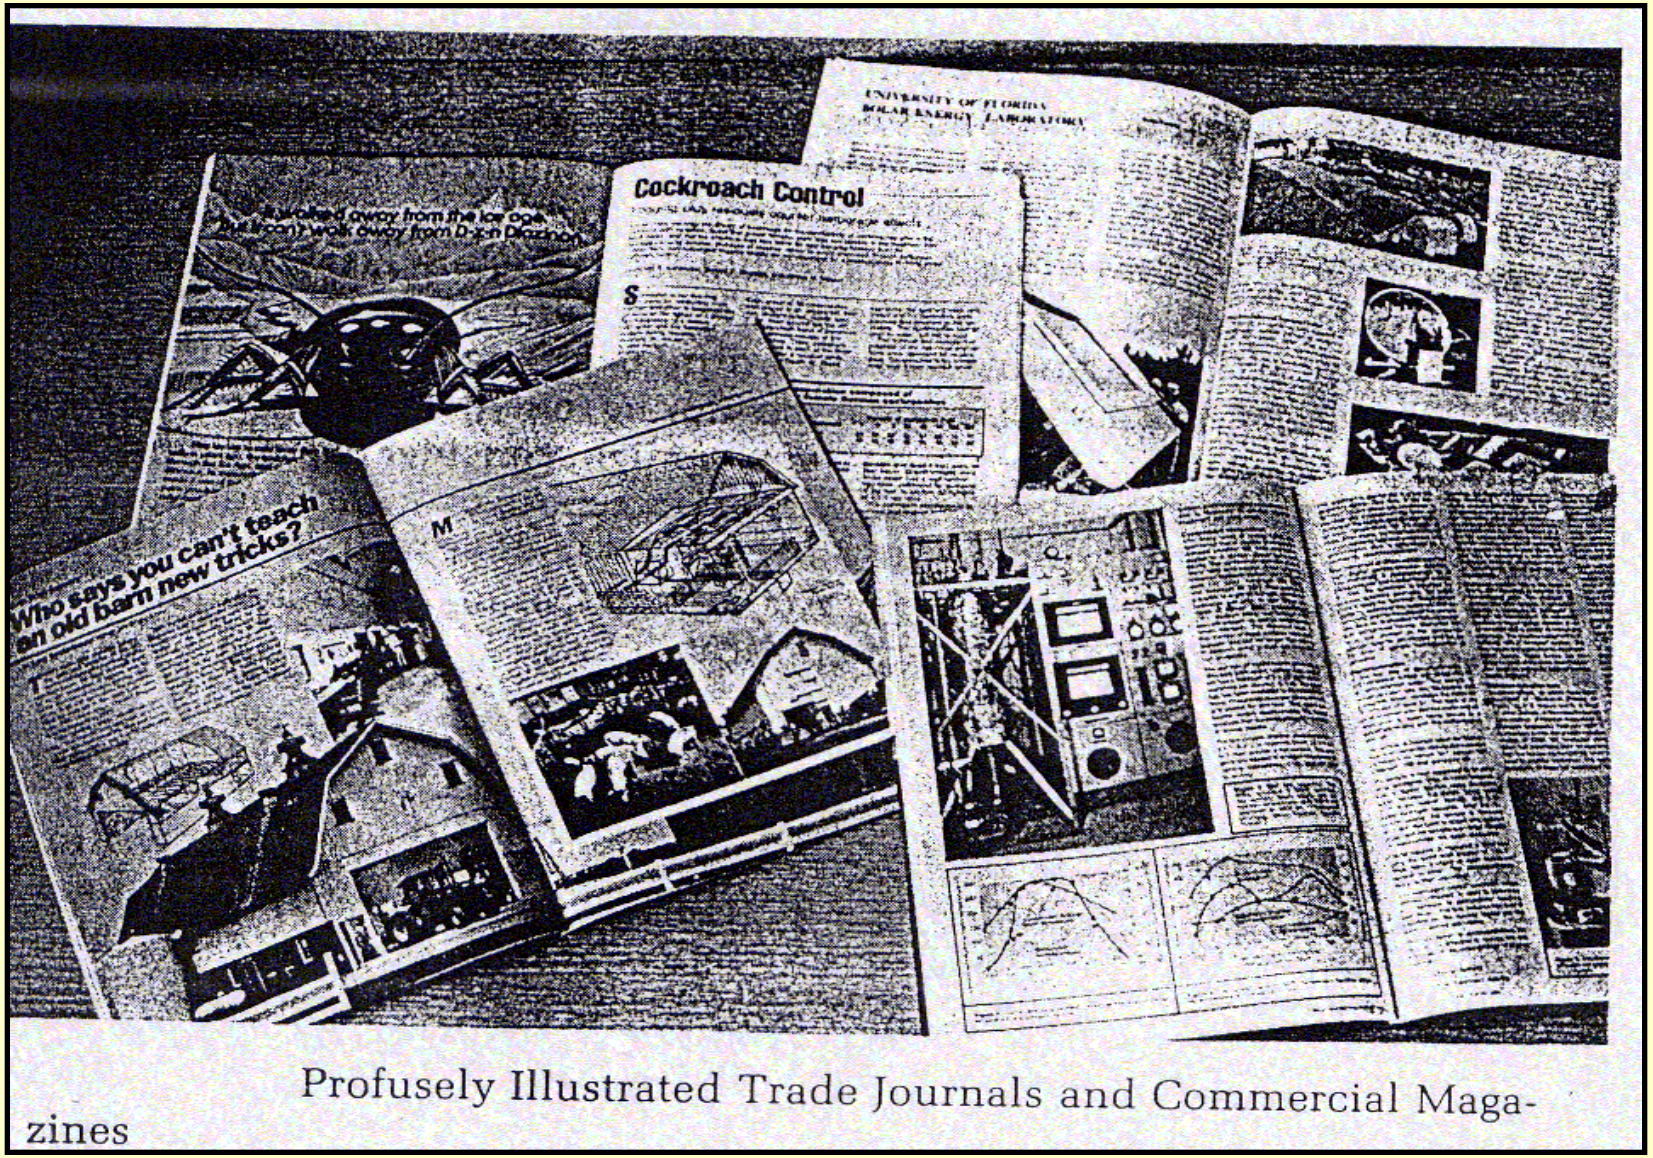

10. Under results section summarize the major measurements and calculated values and present them graphically as tables, charts, etc.
11. In the discussion section start with a clear statement of your major conclusions.
12. Evaluate your methods and results in the light of previous research, conflicts, your own research hypotheses and implications of what you have found.
13. You as a writer are obliged to list all the references you actually cited in the body of your article.

14. Double-check all titles, the spelling of authors' names, and page numbers, Vol. Numbers, date, etc.
15. Technical articles for a professional journals demand excellence.
16. It will have a large and important audience.

Articles for Trade, Commercial and Popular Magazines

1. Technical articles for trade journals and commercial and popular magazines are less rigid in format and free in style than those for professional journals.
2. Such articles may well be accepted for the quality of the photographs and drawings rather than the quality of the writing.
3. They should be interesting and must be presented in an interesting fashion.

4. No general outline for trade, commercial and popular articles.
5. Such articles intersperse personal narratives with description, explanation and instructions as a way of building and maintaining interest.
6. Popular articles are less formal, more conversational and more personal.

Profusely Illustrated Trade Journals and Commercial Magazines

INDEXATION: WILL TAXPAYERS GET ITS BENEFITS?

Considering bracket creep's impact, Congress may have second thoughts, the authors say.

by C. W. Bastable and Stephen L. Fogg

The Economic Recovery Tax Act of 1981 provides for implementation, in 1985, of a system of indexation of individual tax brackets. Indexation keys taxation to purchasing power and represents a major change in tax policy designed to eliminate perceived inequities in the present system that stem from inflation-induced bracket creep. It provides, in effect, through governmental action, a mechanism to help taxpayers stem erosion of the purchasing power of their take-home pay.

However, we are concerned that indexation may not become a reality. Statement of Tax Policy no. 6, *Indexation of the Tax Laws for Inflation*, provides an idea of why the federal government may have second thoughts about implementing indexation when the statement observes, "Indexation . . . stops the increase in taxes that is caused solely by inflation, so that overt action by Congress is required to increase taxes."[1] In the ample time that Congress has available to reflect on its current support of indexation, how palatable will it find the need to take the "overt" action from which it heretofore has been shielded by bracket creep? Will a rising deficit cause defections by indexation supporters? The accounting profession must be on guard against specious arguments to abort indexation, for it may be the only hope the beleaguered taxpayer has.

Statement of Tax Policy no. 6 also notes that "the income earner who receives cost-of-living increases is subjected to . . . bracket creep; he pays higher marginal tax rates and a higher average rate. Therefore, a taxpayer's purchasing power drops even if his income rises as fast as the cost of living."[2] This major impact of bracket creep on CPAs' clients—and on all wage earners who are currently under pressure from the ravages of inflation—makes the subject of bracket creep and indexation enormously significant to the accounting profession. Only if accountants better understand the exact impact of bracket creep and indexation on income can they try to foresee whether governmental policy will be equitable and effective. Such knowledge can help accountants to pass meaningful advice along to lawmakers. As professionals, CPAs' responsibilities to help government in such important decisions is paramount.

To enhance the profession's comprehension of the significance of a change to indexation of individual tax brackets, we examined and measured various ramifications of the bracket-creep phenomenon in relationship to the salaries (or wages) of individuals. We also determined the savings that would be attributable to indexation had it been scheduled for implementation in 1981 instead of 1985. The results afford some startling insights concerning bracket creep, which, unfortunately, will persist for at least four more tax years. Furthermore, the insights make us even more skeptical about whether indexation will be implemented, given the enormous loss of revenue if bracket creep is eliminated.

C.W. BASTABLE, CPA, Ph.D., is professor of business at the Graduate School of Business, Columbia University, New York. A member of the American Institute of CPAs, the American Accounting Association and the Financial Executives Institute, Dr. Bastable is a former book editor for the *Journal of Accountancy*. **STEPHEN L. FOGG**, CPA, Ph.D, is assistant professor of accounting at the School of Business Administration of Temple University, Philadelphia, Pennsylvania. Dr. Fogg is a member of the AICPA, the AAA, the National Association of Accountants and the Pennsylvania Institute of CPAs.

Projections of Salaries, Federal Income Taxes and Aftertax Incomes

To obtain a set of figures for measurement purposes, we made projections for a 1-year interval and a 10-year interval for salaries, federal income taxes and aftertax incomes when salaries were assumed to keep pace with inflation. The projections appear in table 1, page 54.

So that the projections will not be misunderstood and misused, the assumptions employed in making them should be mentioned. We assumed that salaries in general will rise at a rate that matches the inflation rate; of course, they may rise at lower or higher rates. Furthermore, the salaries associated with some of the segments that constitute the total population of salaried personnel may change at different rates than those for other segments. Nonetheless, we believe that the most objective bracket-creep measurements stem from the assumption that salaries keep pace with inflation. To assume otherwise would introduce an additional variable that would cloud measurements.

To enable readers to exercise their own judgments concerning the future course of inflation, we employed 8 percent, 10 percent and 12 percent rates of inflation in making the projections. Given the 12 percent-plus rates that prevailed during much of 1980, the rates are realistic and they encompass commonly mentioned double-digit inflation. To reflect annual compounding for the 10-year interval in part B of table 1, we used respective multipliers of 2.1589250, 2.5937425 and 3.1058482; they are simply 1.08, 1.10 and 1.12, each raised to the tenth power. For example, a $12,000 salary at a compounded annual rate of 8 percent becomes $25,907 ($12,000 × 2.1589250) in 10 years.

The federal income tax figures are for a married taxpayer with four exemptions who files a joint return and does not itemize deductions. We used the 1980 tax table B and schedule Y for all computations. Where appropriate, the 50 percent maximum tax on personal service income was employed; we did not attempt income averaging in those limited instances when it might be applicable.

We recognize that low-income taxpayers ordinarily do not itemize deductions, while many high-income taxpayers do. In not making any allowance for itemized deductions, the federal income tax computations for high-income taxpayers may be overstated. However, we have no universal profiles of high-income taxpayers that permit factoring itemized deductions into the tax computations. Notably, state income taxes qualify as deductions, but there are substantial jurisdictional diversities in state taxation. Rather than increase the subjectivity that would stem from imputing arbitrarily derived deductions, we have accepted the risk of upward bias in the tax computations because of employing the zero-bracket amount (formerly the standard deduction) throughout. We doubt that the bias will have a material effect on any generalizations that stem from the data.

High-income taxpayers often have other income in addition to their salaries, but salaries alone are at issue here. Consequently, we made no attempt to introduce other income. However, each salary in table 1 is, of course, adjusted gross income for federal income tax purposes. For the reader who is so inclined, there is no reason why each salary cannot be

14. Instructions and Manuals

- One of the common forms of communication is instructions and manuals writing.
- You will be called upon to provide specific and detailed instructions for procedures and operations that others will be expected to perform.
- You may have to outline office or laboratory or shop procedures.

- You may have to provide instructions for using or maintaining simple pieces of equipment or apparatus.
- You may have to provide simple written directions just to get things done the way you want them done.

Writing Style for Instructions

- Good instructions are complete and well-illustrated.
- The success of a set of instructions hangs not on elegance of diction and smoothness of phrasing but on completeness of information and clarity of expression.
- Instructions are simple, direct, clear and complete.

Suggestions for Instruction writing

- Use groups of numbered steps.
- Use active voice and imperative mood.
- Use normal English.
- Be religiously consistent with terminology.
- Illustrate profusely.
- Make ample use of notes, cautions and warnings.

The Manuals as Reference Piece

"When all else fails, get out the instruction manual!"

- This is often said and more often believed, for it is a fact that most people regards written instructions as a last resort in case they can't get the procedure or operation figured out on their own.

General Outline for Instruction Manuals

1. Introduction.

A. Purpose of the Manual.

B. Scope of the Manual.

C. Additional References.

2. Physical Description of the Mechanism.

3. Functional Description of the Mechanism.

4. Detailed Instructions *(Sections as Needed)*.

A. Assembly.

B. Installation.

C. Initial Startup.

D. Operation.

E. Maintenance and Trouble-Shooting.

F. Repair and Servicing.

5. Parts List.

15. Employment Applications

- The key components of any employment application package are your resume and your resume cover letter, although you should not neglect letters of inquiry and follow-up correspondence.
- When you seek full-time, permanent employment, you are marketing your knowledge, your skills, and your willingness to work.
- The employment process is a two-way traffic. (A prospective employer and a prospective employee).

The Letter of Inquiry

- Indicate your interest in working for the organization, request for information about the organization, and inquire about the procedure of gaining employment with the organization.
- The letter of inquiry should be brief without going into the details of your background and qualification.
- Make it clear in your first sentences that your letter is just a request for information and not a formal job application.

1010 Second Avenue South
Escanaba, Michigan 49829
February 9, 1983

Dr. James Lemert, Director
Division of Communication Research
School of Journalism
University of Oregon
Eugene, Oregon 97403

Dear Dr. Lemert:

This letter is to inquire into possibilities of employment with your communication research program as a communication research technician. I have a B.S. in Communication Theory from Michigan State University and three years' part-time experience in survey research and in-depth interview techniques.

Having been born and raised in the Pacific Northwest, I am eager to return. I am familiar with the Willamet Valley and I would like very much to make my home there.

If you feel that there might be career opportunities for me at the University of Oregon, may I send you a resume and transcripts?

Sincerely yours,

Steven W. Abels

Representative Letter of Inquiry

Resume

- Resume is a **brief**, **well organized** and **attractive** summary of educational background, work experience, personal data and other qualifications that a prospective employer will use to help him decide whether or not he wants to invite you for an interview.
- The purpose of your resume and application letter is not to get a job, but rather to get an interview.

General Outline for Resume

1. **Personal Data:** Name, Present Address, Telephone Number, Permanent Address, Birth Date, Sex, Marital Status and Dependents, Citizenship, Handicaps, Hobbies.
2. **Educational Background:** High School Data, College Data, Special Schools or Training Programs.
3. **Employment Experience:** Major Jobs, Minor Jobs, Pertinent Volunteer Work.
4. **Additional Goodies:** Special Awards and Honors, Significant Foreign Travel, Languages Spoken and Read, Publications.
5. **References:** Name and Title, Business Address, Business Phone Number.

November 15, 1981

Mr. Gene Ray
Chicago Bridge and Iron, Inc.
76041 22 St.
Fremont, California 10328

Dear Mr. Ray:

This letter is to inquire into the possibility of employment with C.B.I. as an assistant construction engineer. Do you feel that I could be a good team player for C.B.I.?

As the enclosed resume indicates, my career objective is to become a project manager. I like Fremont, California and the challenges C.B.I. has to offer. C.B.I. is large enough to care about the development of its employees' careers. This is the sort of firm with which I would like to share my engineering career.

If you feel my qualifications are what C.B.I. needs, I will be available for an interview at your convenience.

Very truly yours,

Danny L. Forge

Danny L. Forge
